## 1.0 Model Specific Information

This document provides usage information for an Imperas OVP peripheral behavioral model.

The document is split into sections providing specific information for this peripheral, including any ports for connecting into a platform, registers, other component parts, and configuration options and general information for peripheral modeling with Imperas OVP.

### 1.1 Description

Model of the PDB peripheral used on the Freescale Kinetis platform

### 1.2 Limitations

Provides the base behaviour for the OVP Freescale Kinetis platforms

### 1.3 Reference

[www.freescale.com/Kinetis](http://www.freescale.com/Kinetis)

### 1.4 Licensing

Open Source Apache 2.0

### 1.5 Location

The KinetisPDB peripheral model is located in an Imperas/OVP installation at the VLNV: [freescale.ovpworld.org / peripheral / KinetisPDB / 1.0](http://freescale.ovpworld.org/peripheral/KinetisPDB/1.0).

## 2.0 Net Ports

This model has the following net ports:

Table 1. Net Ports

Name	Type	Must Be Connected	Description
Reset	input	F (False)	

## 3.0 Bus Slave Ports

This model has the following bus slave ports:

### 3.1 Bus Slave Port: *bport1*

Table 2. Bus Slave Port: *bport1*

Name	Size (bytes)	Must Be Connected	Description
<i>bport1</i>	0x1000	F (False)	

Table 3. Bus Slave Port: *bport1* Registers:

Name	Offset	Width (bits)	Description	R/W	is Volatile
ab_SC	0x0	32	Status and Control Register, offset: 0x0		

ab_MOD	0x4	32	Modulus Register, offset: 0x4		
ab_CNT	0x8	32	Counter Register, offset: 0x8

ab_CH3S	0x8c	32	Channel n Status Register, array offset:		

			0x14, array step: 0x28		
ab_CH3DLY0	0x90	32	Channel n Delay 0 Register..Channel n Delay 1 Register, array offset: 0x18, array step: index*0x28, index2*0x4		
ab_CH3DLY1	0x94	32	Channel n Delay 0 Register..Channel n Delay 1 Register, array offset: 0x18, array step: index*0x28, index2*0x4		
ab_DACINTC0	0x150	32	DAC Interval Trigger n Control Register, array offset: 0x150, array step: 0x8		
ab_DACINT0	0x154	32	DAC Interval n Register, array offset: 0x154, array step: 0x8		
ab_DACINTC1	0x158	32	DAC Interval Trigger n Control Register, array offset: 0x150, array step: 0x8		
ab_DACINT1	0x15c	32	DAC Interval n Register, array offset: 0x154, array step: 0x8		
ab_POEN	0x190	32	Pulse-Out n Enable Register, offset: 0x190		
ab_PO0DLY	0x194	32	Pulse-Out n Delay Register, array offset: 0x194, array step: 0x4		
ab_PO1DLY	0x198	32	Pulse-Out n Delay Register, array offset: 0x194, array step: 0x4		
ab_PO2DLY	0x19c	32	Pulse-Out n Delay Register, array offset: 0x194, array step: 0x4		
ab_PO3DLY	0x1a0	32	Pulse-Out n Delay Register, array offset: 0x194, array step: 0x4		

#### 4.0 Platforms that use this peripheral component

Peripheral components can be used in many different platforms, including those developed by Imperas or by other users of OVP. You can use this peripheral in your own platforms.

Table 4. Publicly available platforms using peripheral 'KinetisPDB'

Platform Name	Vendor
FreescaleKinetis60	freescale.ovpworld.org
FreescaleKinetis64	freescale.ovpworld.org

## 5.0 Peripheral components in the library

Table 5. Publicly available Imperas/OVP peripheral models (227 models)

## 6.0 General Information on Peripheral Models

This document provides usage information for an Imperas OVP peripheral behavioral model.

The document is split into sections providing specific information for this peripheral, including any ports for connecting into a platform, registers etc. and configuration options and general information for peripheral modeling with Imperas OVP.

### 6.1 Background

Imperas OVP simulation technology enables very high performance simulation, debug and analysis of platforms containing multiple processors and peripheral models. The technology is designed to be extensible: you can create new models of processors, peripherals and other platform components using interfaces and libraries defined by OVP.

The peripheral models created using the OVP APIs run on the Peripheral Simulation Engine (PSE).

The model is typically written in C and compiled into an executable for the PSE processor architecture. The model is compiled for speed of execution and to protect IP. It is dynamically loaded by the simulator at run time.

## 7.0 Building peripherals easily with Imperas iGen

To aid with model creation, Imperas products include iGen, a model generation tool. iGen takes the laborious and error-prone task of constructing the various hardware model and software element files required for a typical model, and automates this process. iGen creates the needed C files. iGen also creates the C++ SystemC TLM2 interface files needed to run peripheral models in SystemC simulations.

iGen takes as input a simple script specification that includes device internals such as registers and memories, port information, component descriptors, and other elements. iGen then builds the C code model files and user editable templates. These include model frameworks with registers, function calls, memory map, and other items. It ensures that all component parts of the model are well-structured using best practices, and are consistent throughout the files, thus eliminating a common source of errors.

More information on iGen can be found: [imperas.com/products](http://imperas.com/products).

## 8.0 Peripheral model internals

Each instance of a peripheral model runs on its own virtual machine with an address space large enough for the model. This processor (the PSE) and its memory are separate from any processors, memories and buses in the platform being simulated; they exist only to execute the code of the peripheral model.

Interception of functions defined in the peripheral model allows the use of features of the host system in the

implementation of the behavior of a peripheral. As an example, a real platform might contain a video display device. When simulating this system, it is generally more convenient not to simulate the complete video display device but to use a video package available on the host machine, such as SDL, and to use this to render to the host display. Also models of uarts, ethernet devices and USB components can make use of the host PC resources during simulation, to allow, for example, a simulation to browse the real internet, or the simulation to connect to a real USB device.

## 9.0 Parts of peripheral models

### *9.1 Configuring the Peripheral Instance with Parameters*

A peripheral can include the behaviour of several configurations. These are controlled when the peripheral is instanced in the platform by setting parameters defined on the peripheral.

### *9.2 Net Ports*

Peripherals may be connected to other peripherals or processors with signal wires (nets). These can be used to act as interrupt signals or used to control behavior between peripherals.

The wires are created in the platform as nets and this net is connected into the peripheral using a net port.

### *9.3 Bus master ports*

A bus master port initiates (and controls the address of) a bus cycle. Bus cycles are generated by behavioral code within the peripheral model.

### *9.4 Bus slave ports*

A peripheral can be defined as having several bus slave ports. The bus slave ports can be split into several address blocks. Each address block be either local memory or memory mapped registers. Both of these can have associated callback functions. A memory mapped register can also be defined as specific read/write access, whether it is volatile, and also whether it is associated with a reset pin and mask. A memory mapped register can also have specific bit fields defined.

### *9.5 Packetnets*

A peripheral can be defined as being connected to packetnet ports. A packetnet is used to model packet based communication such as Ethernet, CAN bus or GSM. A packetnet is created in a platform, then connected to packetnet ports on model instances. A packetnet can have many connections, each able to send or receive packets. A packetnet is used as an efficient method of communication within OVP models.

For more information on modeling with packetnets, please see the peripheral modeling documentation: [OVP\\_Peripheral\\_Modeling\\_Guide.pdf](#), [OVPSim\\_and\\_CpuManager\\_User\\_Guide.pdf](#) and the example: [\\$IMPERAS\\_HOME/Examples/Models/Peripherals/packetnet](#).

## 10.0 More information (documentation) on peripheral models and modeling

More information on modeling and APIs can be found at: [OVPworld.org/technology\\_apis](http://OVPworld.org/technology_apis).

Specifics on modeling peripherals can be found: [OVP\\_Peripheral\\_Modeling\\_Guide.pdf](#).

A full list of the currently available OVP documentation is available: [OVPworld.org/documentation](#).
