Overview

This document provides the details of an OVP Fast Processor Model variant.

OVP Fast Processor Models are written in C and provide a C API for use in C based platforms. The models also provide a native interface for use in SystemC TLM2 platforms.

The models are written using the OVP VMI API that provides a Virtual Machine Interface that defines the behavior of the processor. The VMI API makes a clear line between model and simulator allowing very good optimization and world class high speed performance. Most models are provided as a binary shared object and also as source. This allows the download and use of the model binary or the use of the source to explore and modify the model.

The models are run through an extensive QA and regression testing process and most model families are validated using technology provided by the processor IP owners. There is a companion document (OVP Guide to Using Processor Models) which explains the general concepts of OVP Fast Processor Models and their use. It is downloadable from the OVPworld website documentation pages.

1.1 Description

RISC-V RV32IMC 32-bit processor model

1.2 Licensing

This Model is released under the Open Source Apache 2.0

1.3 Extensions

1.3.1 Extensions Enabled by Default

The model has the following architectural extensions enabled, and the corresponding bits in the misa CSR Extensions field will be set upon reset:

```
misa bit 2: extension C (compressed instructions)
misa bit 8: RV32I/RV64I/RV128I base integer instruction set
```

misa bit 12: extension M (integer multiply/divide instructions)

misa bit 18: extension S (Supervisor mode)

misa bit 20: extension U (User mode)

To specify features that can be dynamically enabled or disabled by writes to the misa register in addition to those listed above, use parameter "add_Extensions_mask". This is a string parameter containing the feature letters to add; for example, value "DV" indicates that double-precision floating point and the Vector Extension can be enabled or disabled by writes to the misa register, if supported on this variant. Parameter "sub_Extensions_mask" can be used to disable dynamic update of features in the same way.

Legacy parameter "misa_Extensions_mask" can also be used. This Uns32-valued parameter specifies all writable bits in the misa Extensions field, replacing any permitted bits defined in the base variant.

Note that any features that are indicated as present in the misa mask but absent in the misa will be ignored. See the next section.

1.3.2 Enabling Other Extensions

The following extensions are supported by the model, but not enabled by default in this variant:

```
misa bit 0: extension A (atomic instructions)
```

```
misa bit 1: extension B (bit manipulation extension)
```

misa bit 3: extension D (double-precision floating point)

misa bit 4: RV32E base integer instruction set (embedded)

misa bit 5: extension F (single-precision floating point)

misa bit 7: extension H (hypervisor)

misa bit 10: extension K (cryptographic)

misa bit 13: extension N (user-level interrupts)

misa bit 15: extension P (DSP instructions)

misa bit 21: extension V (vector extension)

misa bit 23: extension X (non-standard extensions present)

To add features from this list to the visible set in the misa register, use parameter "add_Extensions". This is a string containing identification letters of features to enable; for example, value "DV" indicates that double-precision floating point and the Vector Extension should be enabled, if they are currently absent and are available on this variant.

Legacy parameter "misa_Extensions" can also be used. This Uns32-valued parameter specifies the reset value for the misa CSR Extensions field, replacing any permitted bits defined in the base variant.

To add features from this list to the implicitly-enabled set (not visible in the misa register), use parameter "add_implicit_Extensions". This is a string parameter in the same format as the "add_Extensions" parameter described above.

1.3.3 Disabling Extensions

The following extensions are enabled by default in the model and can be disabled:

misa bit 2: extension C (compressed instructions)

misa bit 12: extension M (integer multiply/divide instructions)

misa bit 18: extension S (Supervisor mode)

misa bit 20: extension U (User mode)

To disable features that are enabled by default, use parameter "sub_Extensions". This is a string containing identification letters of features to disable; for example, value "DF" indicates that double-precision and single-precision floating point extensions should be disabled, if they are enabled by default on this variant.

To remove features from this list from the implicitly-enabled set (not visible in the misa register), use parameter "sub_implicit_Extensions". This is a string parameter in the same format as the "sub_Extensions" parameter described above.

1.4 General Features

1.4.1 mtvec CSR

On this variant, the Machine trap-vector base-address register (mtvec) is writable. It can instead be configured as read-only using parameter "mtvec_is_ro".

Values written to "mtvec" are masked using the value 0xfffffffd. A different mask of writable bits may be specified using parameter "mtvec_mask" if required. In addition, when Vectored interrupt mode is enabled, parameter "tvec_align" may be used to specify additional hardware-enforced base address alignment. In this variant, "tvec_align" defaults to 0, implying no alignment constraint.

If parameter "mtvec_sext" is True, values written to "mtvec" are sign-extended from the most-significant writable bit. In this variant, "mtvec_sext" is False, indicating that "mtvec" is not sign-extended.

The initial value of "mtvec" is 0x0. A different value may be specified using parameter "mtvec" if

required.

1.4.2 stvec CSR

Values written to "stvec" are masked using the value 0xfffffffd. A different mask of writable bits may be specified using parameter "stvec_mask" if required. In addition, when Vectored interrupt mode is enabled, parameter "tvec_align" may be used to specify additional hardware-enforced base address alignment. In this variant, "tvec_align" defaults to 0, implying no alignment constraint.

If parameter "stvec_sext" is True, values written to "stvec" are sign-extended from the most-significant writable bit. In this variant, "stvec_sext" is False, indicating that "stvec" is not sign-extended.

1.4.3 Reset

On reset, the model will restart at address 0x0. A different reset address may be specified using parameter "reset_address" or applied using optional input port "reset_addr" if required.

1.4.4 NMI

On an NMI, the model will restart at address 0x0; a different NMI address may be specified using parameter "nmi_address" or applied using optional input port "nmi_addr" if required. The cause reported on an NMI is 0x0 by default; a different cause may be specified using parameter "ecode_nmi" or applied using optional input port "nmi_cause" if required.

If parameter "rnmi_version" is not "none", resumable NMIs are supported, managed by additional CSRs "mnscratch", "mnepc", "mncause" and "mnstatus", following the indicated version of the Resumable NMI extension proposal. In this variant, "rnmi_version" is "none".

1.4.5 WFI

WFI will halt the processor until an interrupt occurs. It can instead be configured as a NOP using parameter "wfi_is_nop". WFI timeout wait is implemented with a time limit of 0 (i.e. WFI causes an Illegal Instruction trap in Supervisor mode when mstatus.TW=1).

1.4.6 cycle CSR

The "cycle" CSR is implemented in this variant. Set parameter "cycle_undefined" to True to instead specify that "cycle" is unimplemented and reads of it should cause Illegal Instruction traps.

1.4.7 time CSR

The "time" CSR is implemented in this variant. Set parameter "time_undefined" to True to instead specify that "time" is unimplemented and reads of it should cause Illegal Instruction traps. Usually,

the value of the "time" CSR should be provided by the platform - see notes below about the artifact "CSR" bus for information about how this is done.

1.4.8 instret CSR

The "instret" CSR is implemented in this variant. Set parameter "instret_undefined" to True to instead specify that "instret" is unimplemented and reads of it should cause Illegal Instruction traps.

1.4.9 hpmcounter CSRs

"hpmcounter" CSRs are implemented in this variant. Set parameter "hpmcounter_undefined" to True to instead specify that "hpmcounter" CSRs are unimplemented and reads of them should cause Illegal Instruction traps.

1.4.10 Virtual Memory

This variant supports address translation modes 0 (bare) and 1 (Sv32). Use parameter "Sv_modes" to specify a bit mask of different implemented modes if required; for example, setting "Sv_modes" to (1 << 0)+(1 << 8) indicates that mode 0 (bare) and mode 8 (Sv39) are implemented. These indices correspond to writable values in the satp.MODE CSR field.

A 9-bit ASID is implemented. Use parameter "ASID_bits" to specify a different implemented ASID size if required.

TLB behavior is controlled by parameter "ASIDCacheSize". If this parameter is 0, then an unlimited number of TLB entries will be maintained concurrently. If this parameter is non-zero, then only TLB entries for up to "ASIDCacheSize" different ASIDs will be maintained concurrently initially; as new ASIDs are used, TLB entries for less-recently used ASIDs are deleted, which improves model performance in some cases. If the model detects that the TLB entry cache is too small (entry ejections are very frequent), it will increase the cache size automatically. In this variant, "ASIDCacheSize" is 8.

1.4.11 Unaligned Accesses

Unaligned memory accesses are not supported by this variant. Set parameter "unaligned" to "T" to enable such accesses.

1.4.12 PMP

16 PMP entries are implemented by this variant. Use parameter "PMP_registers" to specify a different number of PMP entries; set the parameter to 0 to disable the PMP unit. The PMP grain size (G) is 0, meaning that PMP regions as small as 4 bytes are implemented. Use parameter "PMP_grain" to specify a different grain size if required. Unaligned PMP accesses are not decom-

posed into separate aligned accesses; use parameter "PMP_decompose" to modify this behavior if required.

1.5 Compressed Extension

Standard compressed instructions are present in this variant.

Parameter Zcea_version is used to specify the version of Zcea instructions present. By default, Zcea_version is set to "none" in this variant. Updates to this parameter require a commercial product license.

Parameter Zceb_version is used to specify the version of Zceb instructions present. By default, Zceb_version is set to "none" in this variant. Updates to this parameter require a commercial product license.

Parameter Zcee_version is used to specify the version of Zcee instructions present. By default, Zcee_version is set to "none" in this variant. Updates to this parameter require a commercial product license.

1.6 Privileged Architecture

This variant implements the Privileged Architecture with version specified in the References section of this document. Note that parameter "priv_version" can be used to select the required architecture version; see the following sections for detailed information about differences between each supported version.

1.6.1 Legacy Version 1.10

1.10 version of May 7 2017.

1.6.2 Version 20190608

Stable 1.11 version of June 8 2019, with these changes compared to version 1.10:

- mcountinhibit CSR defined;
- pages are never executable in Supervisor mode if page table entry U bit is 1;
- mstatus.TW is writable if any lower-level privilege mode is implemented (previously, it was just if Supervisor mode was implemented);

1.6.3 Version master

Unstable master version corresponding to evolving 1.12 specification, with these changes compared to version 20190608:

- mstatush, mseccfg, mseccfgh, menvcfg, menvcfgh, senvcfg, henvcfgh and mconfigptr CSRs defined;
- xret instructions clear mstatus.MPRV when leaving Machine mode if new mode is less privileged than M-mode;
- maximum number of PMP registers increased to 64;
- data endian is now configurable.

1.7 Unprivileged Architecture

This variant implements the Unprivileged Architecture with version specified in the References section of this document. Note that parameter "user_version" can be used to select the required architecture version; see the following sections for detailed information about differences between each supported version.

1.7.1 Legacy Version 2.2

2.2 version of May 7 2017.

1.7.2 Version 20191213

Stable 20191213-Base-Ratified version of December 13 2019, with these changes compared to version 2.2:

- floating point fmin/fmax instruction behavior modified to comply with IEEE 754-201x.
- numerous other optional behaviors can be separately enabled using Z-prefixed parameters.

1.8 Other Extensions

Other extensions that can be configured are described in this section.

1.8.1 Zmmul

Parameter "Zmmul" is 0 on this variant, meaning that all multiply and divide instructions are implemented. if "Zmmul" is set to 1 then multiply instructions are implemented but divide and remainder instructions are not implemented.

1.8.2 Zicsr

Parameter "Zicsr" is 1 on this variant, meaning that standard CSRs and CSR access instructions are implemented. if "Zicsr" is set to 0 then standard CSRs and CSR access instructions are not implemented and an alternative scheme must be provided as a processor extension.

1.8.3 Zifencei

Parameter "Zifencei" is 1 on this variant, meaning that the fence.i instruction is implemented (but treated as a NOP by the model). if "Zifencei" is set to 0 then the fence.i instruction is not implemented.

1.8.4 **Zichom**

Parameter "Zicbom" is 0 on this variant, meaning that code block management instructions are undefined. if "Zicbom" is set to 1 then code block management instructions cbo.clean, cbo.flush and cbo.inval are defined.

If Zicbom is present, the cache block size is given by parameter "cmomp_bytes". The instructions may cause traps if used illegally but otherwise are NOPs in this model.

1.8.5 **Zicbop**

Parameter "Zicbop" is 0 on this variant, meaning that prefetch instructions are undefined. if "Zicbop" is set to 1 then prefetch instructions prefetch.i, prefetch.r and prefetch.w are defined (but behave as NOPs in this model).

1.8.6 Zicboz

Parameter "Zicboz" is 0 on this variant, meaning that the cbo.zero instruction is undefined. if "Zicboz" is set to 1 then the cbo.zero instruction is defined.

If Zicboz is present, the cache block size is given by parameter "cmoz_bytes".

1.9 CLIC

The model can be configured to implement a Core Local Interrupt Controller (CLIC) using parameter "CLICLEVELS"; when non-zero, the CLIC is present with the specified number of interrupt levels (2-256), as described in the RISC-V Core-Local Interrupt Controller specification, and further parameters are made available to configure other aspects of the CLIC. "CLICLEVELS" is zero in this variant, indicating that a CLIC is not implemented.

1.10 Interrupts

The "reset" port is an active-high reset input. The processor is halted when "reset" goes high and resumes execution from the reset address specified using the "reset_address" parameter or "reset_addr" port when the signal goes low. The "mcause" register is cleared to zero.

The "nmi" port is an active-high NMI input. The processor resumes execution from the address specified using the "nmi_address" parameter or "nmi_addr" port when the NMI signal goes high.

The "mcause" register is cleared to zero.

All other interrupt ports are active high. For each implemented privileged execution level, there are by default input ports for software interrupt, timer interrupt and external interrupt; for example, for Machine mode, these are called "MSWInterrupt", "MTimerInterrupt" and "MExternalInterrupt", respectively. When the N extension is implemented, ports are also present for User mode. Parameter "unimp_int_mask" allows the default behavior to be changed to exclude certain interrupt ports. The parameter value is a mask in the same format as the "mip" CSR; any interrupt corresponding to a non-zero bit in this mask will be removed from the processor and read as zero in "mip", "mie" and "mideleg" CSRs (and Supervisor and User mode equivalents if implemented).

Parameter "external_int_id" can be used to enable extra interrupt ID input ports on each hart. If the parameter is True then when an external interrupt is applied the value on the ID port is sampled and used to fill the Exception Code field in the "mcause" CSR (or the equivalent CSR for other execution levels). For Machine mode, the extra interrupt ID port is called "MExternalInterruptID".

The "deferint" port is an active-high artifact input that, when written to 1, prevents any pendingand-enabled interrupt being taken (normally, such an interrupt would be taken on the next instruction after it becomes pending-and-enabled). The purpose of this signal is to enable alignment with hardware models in step-and-compare usage.

1.11 Debug Mode

The model can be configured to implement Debug mode using parameter "debug_mode". This implements features described in Chapter 4 of the RISC-V External Debug Support specification with version specified by parameter "debug_version" (see References). Some aspects of this mode are not defined in the specification because they are implementation-specific; the model provides infrastructure to allow implementation of a Debug Module using a custom harness. Features added are described below.

Parameter "debug_mode" can be used to specify three different behaviors, as follows:

- 1. If set to value "vector", then operations that would cause entry to Debug mode result in the processor jumping to the address specified by the "debug_address" parameter. It will execute at this address, in Debug mode, until a "dret" instruction causes return to non-Debug mode. Any exception generated during this execution will cause a jump to the address specified by the "dexc_address" parameter.
- 2. If set to value "interrupt", then operations that would cause entry to Debug mode result in the processor simulation call (e.g. opProcessorSimulate) returning, with a stop reason of OP_SR_INTERRUPT. In this usage scenario, the Debug Module is implemented in the simulation harness.
- 3. If set to value "halt", then operations that would cause entry to Debug mode result in the processor halting. Depending on the simulation environment, this might cause a return from the simulation call with a stop reason of OP_SR_HALT, or debug mode might be implemented by another platform component which then restarts the debugged processor again.

1.11.1 Debug State Entry

The specification does not define how Debug mode is implemented. In this model, Debug mode is enabled by a Boolean pseudo-register, "DM". When "DM" is True, the processor is in Debug mode. When "DM" is False, mode is defined by "mstatus" in the usual way.

Entry to Debug mode can be performed in any of these ways:

- 1. By writing True to register "DM" (e.g. using opProcessorRegWrite) followed by simulation of at least one cycle (e.g. using opProcessorSimulate), dcsr cause will be reported as trigger;
- 2. By writing a 1 then 0 to net "haltreq" (using opNetWrite) followed by simulation of at least one cycle (e.g. using opProcessorSimulate);
- 3. By writing a 1 to net "resethaltreq" (using opNetWrite) while the "reset" signal undergoes a negedge transition, followed by simulation of at least one cycle (e.g. using opProcessorSimulate);
- 4. By executing an "ebreak" instruction when Debug mode entry for the current processor mode is enabled by dcsr.ebreakm, dcsr.ebreaks or dcsr.ebreaku.

In all cases, the processor will save required state in "dpc" and "dcsr" and then perform actions described above, depending in the value of the "debug_mode" parameter.

1.11.2 Debug State Exit

Exit from Debug mode can be performed in any of these ways:

- 1. By writing False to register "DM" (e.g. using opProcessorRegWrite) followed by simulation of at least one cycle (e.g. using opProcessorSimulate);
- 2. By executing an "dret" instruction when Debug mode.

In both cases, the processor will perform the steps described in section 4.6 (Resume) of the Debug specification.

1.11.3 Debug Registers

When Debug mode is enabled, registers "dcsr", "dpc", "dscratch0" and "dscratch1" are implemented as described in the specification. These may be manipulated externally by a Debug Module using opProcessorRegRead or opProcessorRegWrite; for example, the Debug Module could write "dcsr" to enable "ebreak" instruction behavior as described above, or read and write "dpc" to emulate stepping over an "ebreak" instruction prior to resumption from Debug mode.

1.11.4 Debug Mode Execution

The specification allows execution of code fragments in Debug mode. A Debug Module implementation can cause execution in Debug mode by the following steps:

- 1. Write the address of a Program Buffer to the program counter using opProcessorPCSet;
- 2. If "debug_mode" is set to "halt", write 0 to pseudo-register "DMStall" (to leave halted state);

3. If entry to Debug mode was handled by exiting the simulation callback, call opProcessorSimulate or opRootModuleSimulate to resume simulation.

Debug mode will be re-entered in these cases:

- 1. By execution of an "ebreak" instruction; or:
- 2. By execution of an instruction that causes an exception.

In both cases, the processor will either jump to the debug exception address, or return control immediately to the harness, with stopReason of OP_SR_INTERRUPT, or perform a halt, depending on the value of the "debug_mode" parameter.

1.11.5 Debug Single Step

When in Debug mode, the processor or harness can cause a single instruction to be executed on return from that mode by setting dcsr.step. After one non-Debug-mode instruction has been executed, control will be returned to the harness. The processor will remain in single-step mode until dcsr.step is cleared.

1.11.6 Debug Ports

Port "DM" is an output signal that indicates whether the processor is in Debug mode

Port "haltreq" is a rising-edge-triggered signal that triggers entry to Debug mode (see above).

Port "resethaltreq" is a level-sensitive signal that triggers entry to Debug mode after reset (see above).

1.12 Trigger Module

This model is configured with a trigger module, implementing a subset of the behavior described in Chapter 5 of the RISC-V External Debug Support specification with version specified by parameter "debug_version" (see References).

1.12.1 Trigger Module Restrictions

The model currently supports tdata1 of type 0, type 2 (mcontrol), type 3 (icount), type 4 (itrigger), type 5 (etrigger) and type 6 (mcontrol6). icount triggers are implemented for a single instruction only, with count hard-wired to 1 and automatic zeroing of mode bits when the trigger fires.

1.12.2 Trigger Module Parameters

Parameter "trigger_num" is used to specify the number of implemented triggers. In this variant, "trigger_num" is 4.

Parameter "tinfo" is used to specify the value of the read-only "tinfo" register, which indicates the trigger types supported. In this variant, "tinfo" is 0x7d.

Parameter "tinfo_undefined" is used to specify whether the "tinfo" register is undefined, in which case reads of it trap to Machine mode. In this variant, "tinfo_undefined" is 0.

Parameter "tcontrol_undefined" is used to specify whether the "tcontrol" register is undefined, in which case accesses to it trap to Machine mode. In this variant, "tcontrol_undefined" is 0.

Parameter "mcontext_undefined" is used to specify whether the "mcontext" register is undefined, in which case accesses to it trap to Machine mode. In this variant, "mcontext_undefined" is 0.

Parameter "scontext_undefined" is used to specify whether the "scontext" register is undefined, in which case accesses to it trap to Machine mode. In this variant, "scontext_undefined" is 0.

Parameter "mscontext_undefined" is used to specify whether the "mscontext" register is undefined, in which case accesses to it trap to Machine mode. In this variant, "mscontext_undefined" is 0.

Parameter "amo_trigger" is used to specify whether load/store triggers are activated for AMO instructions. In this variant, "amo_trigger" is 0.

Parameter "no_hit" is used to specify whether the "hit" bit in tdata1 is unimplemented. In this variant, "no_hit" is 0.

Parameter "no_sselect_2" is used to specify whether the "sselect" field in "textra32"/"textra64" registers is unable to hold value 2 (indicating match by ASID is not allowed). In this variant, "no_sselect_2" is 0.

Parameter "mcontext_bits" is used to specify the number of writable bits in the "mcontext" register. In this variant, "mcontext_bits" is 6.

Parameter "scontext_bits" is used to specify the number of writable bits in the "scontext" register. In this variant, "scontext_bits" is 16.

Parameter "mvalue_bits" is used to specify the number of writable bits in the "mvalue" field in "textra32"/"textra64" registers; if zero, the "mselect" field is tied to zero. In this variant, "mvalue_bits" is 6.

Parameter "svalue_bits" is used to specify the number of writable bits in the "svalue" field in "textra32"/"textra64" registers; if zero, the "sselect" is tied to zero. In this variant, "svalue_bits" is 16.

Parameter "mcontrol_maskmax" is used to specify the value of field "maskmax" in the "mcontrol" register. In this variant, "mcontrol_maskmax" is 63.

1.13 Debug Mask

It is possible to enable model debug messages in various categories. This can be done statically using the "override_debugMask" parameter, or dynamically using the "debugflags" command. Enabled messages are specified using a bitmask value, as follows:

Value 0x002: enable debugging of PMP and virtual memory state;

Value 0x004: enable debugging of interrupt state.

All other bits in the debug bitmask are reserved and must not be set to non-zero values.

1.14 Integration Support

This model implements a number of non-architectural pseudo-registers and other features to facilitate integration.

1.14.1 CSR Register External Implementation

If parameter "enable_CSR_bus" is True, an artifact 16-bit bus "CSR" is enabled. Slave callbacks installed on this bus can be used to implement modified CSR behavior (use opBusSlaveNew or icmMapExternalMemory, depending on the client API). A CSR with index 0xABC is mapped on the bus at address 0xABC0; as a concrete example, implementing CSR "time" (number 0xC01) externally requires installation of callbacks at address 0xC010 on the CSR bus.

1.14.2 Page Table Walk Introspection

Artifact register "PTWStage" shows the active page table translation stage (0 if no stage active, 1 if HS-stage active, 2 if VS-stage active and 3 if G-stage active). This register is visibly non-zero only in a memory access callback triggered by a page table walk event.

Artifact register "PTWInputAddr" shows the input address of active page table translation. This register is visibly non-zero only in a memory access callback triggered by a page table walk event.

Artifact register "PTWLevel" shows the active level of page table translation (corresponding to index variable "i" in the algorithm described by Virtual Address Translation Process in the RISC-V Privileged Architecture specification). This register is visibly non-zero only in a memory access callback triggered by a page table walk event.

1.15 Limitations

Instruction pipelines are not modeled in any way. All instructions are assumed to complete immediately. This means that instruction barrier instructions (e.g. fence.i) are treated as NOPs, with the exception of any Illegal Instruction behavior, which is modeled.

Caches and write buffers are not modeled in any way. All loads, fetches and stores complete immediately and in order, and are fully synchronous. Data barrier instructions (e.g. fence) are treated as NOPs, with the exception of any Illegal Instruction behavior, which is modeled.

Real-world timing effects are not modeled: all instructions are assumed to complete in a single cycle.

Hardware Performance Monitor registers are not implemented and hardwired to zero.

The TLB is architecturally-accurate but not device accurate. This means that all TLB maintenance and address translation operations are fully implemented but the cache is larger than in the real device.

1.16 Verification

All instructions have been extensively tested by Imperas, using tests generated specifically for this model and also reference tests from https://github.com/riscv/riscv-tests.

Also reference tests have been used from various sources including:

https://github.com/riscv/riscv-tests

https://github.com/ucb-bar/riscv-torture

The Imperas OVPsim RISC-V models are used in the RISC-V Foundation Compliance Framework as a functional Golden Reference:

https://github.com/riscv/riscv-compliance

where the simulated model is used to provide the reference signatures for compliance testing. The Imperas OVPsim RISC-V models are used as reference in both open source and commercial instruction stream test generators for hardware design verification, for example:

http://valtrix.in/sting from Valtrix

https://github.com/google/riscv-dv from Google

The Imperas OVPsim RISC-V models are also used by commercial and open source RISC-V Core RTL developers as a reference to ensure correct functionality of their IP.

1.17 References

The Model details are based upon the following specifications:

RISC-V Instruction Set Manual, Volume I: User-Level ISA (User Architecture Version 20191213)

RISC-V Instruction Set Manual, Volume II: Privileged Architecture (Privileged Architecture Version Ratified-IMFDQC-and-Priv-v1.11)

Configuration

2.1 Location

This model's VLNV is riscv.ovpworld.org/processor/riscv/1.0.

The model source is usually at:

\$IMPERAS_HOME/ImperasLib/source/riscv.ovpworld.org/processor/riscv/1.0

The model binary is usually at:

\$IMPERAS_HOME/lib/\$IMPERAS_ARCH/ImperasLib/riscv.ovpworld.org/processor/riscv/1.0

2.2 GDB Path

The default GDB for this model is: \$IMPERAS_HOME/lib/\$IMPERAS_ARCH/gdb/riscv-none-embed-gdb.

2.3 Semi-Host Library

The default semi-host library file is riscv.ovpworld.org/semihosting/pk/1.0

2.4 Processor Endian-ness

This is a LITTLE endian model.

2.5 QuantumLeap Support

This processor is qualified to run in a QuantumLeap enabled simulator.

2.6 Processor ELF code

The ELF code supported by this model is: 0xf3.

Table 3.1: All Variants in this model

Bus Master Ports

This model has these bus master ports.

Name	min	max	Connect?	Description
INSTRUCTION	32	34	mandatory	Instruction bus
DATA	32	34	optional	Data bus

Table 4.1: Bus Master Ports

Bus Slave Ports

This model has no bus slave ports.

Net Ports

This model has these net ports.

Name	Type	Connect?	Description
reset	input	optional	Reset
reset_addr	input	optional	externally-applied reset address
nmi	input	optional	NMI
nmi_cause	input	optional	externally-applied NMI cause
nmi_addr	input	optional	externally-applied NMI address
SSWInterrupt	input	optional	Supervisor software interrupt
MSWInterrupt	input	optional	Machine software interrupt
STimerInterrupt	input	optional	Supervisor timer interrupt
MTimerInterrupt	input	optional	Machine timer interrupt
SExternalInterrupt	input	optional	Supervisor external interrupt
MExternalInterrupt	input	optional	Machine external interrupt
irq_ack_o	output	optional	interrupt acknowledge (pulse)
irq_id_o	output	optional	acknowledged interrupt id (valid during
			irq_ack_o pulse)
sec_lvl_o	output	optional	current privilege level
deferint	input	optional	Artifact signal causing interrupts to be
			held off when high

Table 6.1: Net Ports

FIFO Ports

This model has no FIFO ports.

Formal Parameters

Name	Type	Description
Fundamental		
variant Enumeration		Selects variant (either a generic UISA or a specific model)
user_version	Enumeration	Specify required User Architecture version (2.2, 2.3, 20190305 or 20191213)
priv_version	Enumeration	Specify required Privileged Architecture version (1.10, 1.11, 20190405, 20190608 or master)
numHarts	Uns32	Specify the number of hart contexts in a multiprocessor
endian	Endian	Model endian
enable_expanded	Boolean	Specify that 48-bit and 64-bit expanded instructions are supported
endianFixed	Boolean	Specify that data endianness is fixed (mstatus.{MBE,SBE,UBE} fields are read-only)
misa_MXL	Uns32	Override default value of misa.MXL
misa_Extensions	Uns32	Override default value of misa. Extensions
add_Extensions	String	Add extensions specified by letters to misa. Extensions (for example, specify "VD" to add V and D features)
sub_Extensions	String	Remove extensions specified by letters from misa. Extensions (for example, specify "VD" to remove V and D features)
misa_Extensions_mask	Uns32	Override mask of writable bits in misa. Extensions
add_Extensions_mask	String	Add extensions specified by letters to mask of writable bits in misa. Extensions (for example, specify "VD" to add V and D features)
sub_Extensions_mask	String	Remove extensions specified by letters from mask of writable bits in misa. Extensions (for example, specify "VD" to remove V and D features)
add_implicit_Extensions	String	Add extensions specified by letters to implicitly-present extensions not visible in misa. Extensions
sub_implicit_Extensions	String	Remove extensions specified by letters from implicitly-present extensions not visible in misa. Extensions
Zicsr	Boolean	Specify that Zicsr is implemented
Zifencei	Boolean	Specify that Zifencei is implemented
Zicbom	Boolean	Specify that Zicbom is implemented
Zicbop	Boolean	Specify that Zicbop is implemented
Zicboz	Boolean	Specify that Zicboz is implemented
Zmmul	Boolean	Specify that Zmmul is implemented
Debug		
debug_version	Enumeration	Specify required Debug Architecture version (0.13.2-DRAFT, 0.14.0-DRAFT or 1.0.0-STABLE)
debug_mode	Enumeration	Specify how Debug mode is implemented (none, vector, interrupt or halt)
Interrupts_Exceptions		· · · · · · · · · · · · · · · · · · ·
rnmi_version	Enumeration	Specify required RNMI Architecture version (none or 0.2.1)
mtvec_is_ro	Boolean	Specify whether mtvec CSR is read-only

tvec_align	Uns32	Specify hardware-enforced alignment of mtvec/stvec/utvec when Vectored
tvec_angn	Uns32	interrupt mode enabled
ecode_mask	Uns64	Specify hardware-enforced mask of writable bits in xcause. Exception Code
ecode_nmi	Uns64	Specify xcause. ExceptionCode for NMI
tval_zero	Boolean	Specify whether mtval/stval/utval are hard wired to zero
tval_zero_ebreak	Boolean	Specify whether mtval/stval/utval are set to zero by an ebreak
tval_ii_code	Boolean	Specify whether mtval/stval contain faulting instruction bits on illegal
		instruction exception
reset_address	Uns64	Override reset vector address
nmi_address	Uns64	Override NMI vector address
CLINT_address	Uns64	Specify base address of internal CLINT model (or 0 for no CLINT)
local_int_num	Uns32	Specify number of supplemental local interrupts
unimp_int_mask	Uns64	Specify mask of unimplemented interrupts (e.g. 1<<9 indicates Supervisor external interrupt unimplemented)
force_mideleg	Uns64	Specify mask of interrupts always delegated to lower-priority execution
		level from Machine execution level
force_sideleg	Uns64	Specify mask of interrupts always delegated to User execution level from
		Supervisor execution level
no_ideleg	Uns64	Specify mask of interrupts that cannot be delegated to lower-priority ex-
_		ecution levels
no_edeleg	Uns64	Specify mask of exceptions that cannot be delegated to lower-priority ex-
<u> </u>		ecution levels
external_int_id	Boolean	Whether to add nets allowing External Interrupt ID codes to be forced
Simulation_Artifact		
use_hw_reg_names	Boolean	Specify whether to use hardware register names x0-x31 and f0-f31 instead
		of ABI register names
verbose	Boolean	Specify verbose output messages
traceVolatile	Boolean	Specify whether volatile registers (e.g. minstret) should be shown in change trace
enable_CSR_bus	Boolean	Add artifact CSR bus port, allowing CSR registers to be externally im-
		plemented
CSR_remap	String	Comma-separated list of CSR number mappings, each of the form <csr-name>=<number></number></csr-name>
ASID_cache_size	Uns32	Specifies the number of different ASIDs for which TLB entries are cached; a value of 0 implies no limit
Memory		<u> </u>
updatePTEA	Boolean	Specify whether hardware update of PTE A bit is supported
updatePTED	Boolean	Specify whether hardware update of PTE D bit is supported
unaligned	Boolean	Specify whether the processor supports unaligned memory accesses
ASID_bits	Uns32	Specify the number of implemented ASID bits
PMP_grain	Uns32	Specify PMP region granularity, G (0 =>4 bytes, 1 =>8 bytes, etc)
PMP_registers	Uns32	Specify the number of implemented PMP address registers
PMP_max_page	Uns32	Specify the maximum size of PMP region to map if non-zero (may improve
r		performance; constrained to a power of two)
PMP_decompose	Boolean	Whether unaligned PMP accesses are decomposed into separate aligned
•		accesses
Sv_modes	Uns32	Specify bit mask of implemented address translation modes (e.g. (1<<0)+(1<<8) indicates "bare" and "Sv39" modes may be selected in satp.MODE)
Svnapot_page_mask	Uns64	Specify mask of implemented Svnapot intermediate page sizes (e.g. 1<<16 means 64KiB contiguous regions are supported)
Svpbmt	Boolean	Specify that Sypbmt is implemented (page-based memory types)
Svinval	Boolean	Specify that Syponic is implemented (fine-grained address translation cache invalidation)
Instruction CCD Deleti		iiivaiidatiOii)
$Instruction_CSR_Behavior$		

wfi_is_nop	Boolean	Specify whether WFI should be treated as a NOP (if not, halt while
wii_is_iiop	Doolean	waiting for interrupts)
counteren_mask	Uns32	Specify hardware-enforced mask of writable bits in mcounteren/scoun-
counterenantask	0 11392	teren registers
noinhibit_mask	Uns32	Specify hardware-enforced mask of always-zero bits in mcountinhibit reg-
	0 11502	ister
cycle_undefined	Boolean	Specify that the cycle CSR is undefined
time_undefined	Boolean	Specify that the time CSR is undefined
instret_undefined	Boolean	Specify that the instret CSR is undefined
hpmcounter_undefined	Boolean	Specify that the hpmcounter CSRs are undefined
CSR_Masks		ar y y a war a r
mtvec_mask	Uns64	Specify hardware-enforced mask of writable bits in mtvec register
stvec_mask	Uns64	Specify hardware-enforced mask of writable bits in stvec register
tdata1_mask	Uns64	Specify hardware-enforced mask of writable bits in Trigger Module tdata1
		register
mip_mask	Uns64	Specify hardware-enforced mask of writable bits in mip register
sip_mask	Uns64	Specify hardware-enforced mask of writable bits in sip register
mtvec_sext	Boolean	Specify whether mtvec is sign-extended from most-significant bit
stvec_sext	Boolean	Specify whether stvec is sign-extended from most-significant bit
Trigger		
tinfo_undefined	Boolean	Specify that the tinfo CSR is undefined
tcontrol_undefined	Boolean	Specify that the tcontrol CSR is undefined
mcontext_undefined	Boolean	Specify that the moontext CSR is undefined
scontext_undefined	Boolean	Specify that the scontext CSR is undefined
mscontext_undefined	Boolean	Specify that the mscontext CSR is undefined (Debug Version 0.14.0 and
		later)
amo_trigger	Boolean	Specify whether AMO load/store operations activate triggers
no_hit	Boolean	Specify that tdata1.hit is unimplemented
no_sselect_2	Boolean	Specify that textra.sselect=2 is not supported (no trigger match by ASID)
trigger_num	Uns32	Specify the number of implemented hardware triggers
tinfo	Uns32	Override tinfo register (for all triggers)
mcontext_bits	Uns32	Specify the number of implemented bits in mcontext
scontext_bits	Uns32	Specify the number of implemented bits in scontext
mvalue_bits	Uns32	Specify the number of implemented bits in textra.mvalue (if zero, tex-
		tra.mselect is tied to zero)
svalue_bits	Uns32	Specify the number of implemented bits in textra.svalue (if zero, tex-
		tra.sselect is tied to zero)
mcontrol_maskmax	Uns32	Specify mcontrol.maskmax value
CSR_Defauts		
mvendorid	Uns64	Override mvendorid register
marchid	Uns64	Override marchid register
mimpid	Uns64	Override mimpid register
mhartid	Uns64	Override mhartid register (or first mhartid of an incrementing sequence if
		this is an SMP variant)
mtvec	Uns64	Override mtvec register
Floating_Point		
mstatus_FS_zero	Boolean	Specify that mstatus.FS is hard-wired to zero
Compressed		
Zcea_version	Enumeration	Specify version of Zcea implemented (code-size reduction extension) (none or $0.50.1$)
Zceb_version	Enumeration	Specify version of Zceb implemented (code-size reduction extension) (none or 0.50.1)
Zcee_version	Enumeration	Specify version of Zcee implemented (code-size reduction extension) (none or 1.0.0-rc)
Fast_Interrupt		,
•		i e e e e e e e e e e e e e e e e e e e

CLICLEVELS	Uns32	Specify number of interrupt levels implemented by CLIC, or 0 if CLIC
		absent

Table 8.1: Parameters that can be set in: Hart

8.1 Parameters with enumerated types

8.1.1 Parameter user_version

Set to this value	Description
2.2	User Architecture Version 2.2
2.3	Deprecated and equivalent to 20191213
20190305	Deprecated and equivalent to 20191213
20191213	User Architecture Version 20191213

Table 8.2: Values for Parameter user_version

8.1.2 Parameter priv_version

Set to this value	Description
1.10	Privileged Architecture Version 1.10
1.11	Deprecated and equivalent to 20190608
20190405	Deprecated and equivalent to 20190608
20190608	Privileged Architecture Version Ratified-IMFDQC-and-Priv-v1.11
master	Privileged Architecture Master Branch (1.12 draft)

Table 8.3: Values for Parameter priv_version

8.1.3 Parameter debug_version

Set to this value	Description
0.13.2-DRAFT	RISC-V External Debug Support Version 0.13.2-DRAFT
0.14.0-DRAFT	RISC-V External Debug Support Version 0.14.0-DRAFT
1.0.0-STABLE	RISC-V External Debug Support Version 1.0.0-STABLE

Table 8.4: Values for Parameter debug_version

8.1.4 Parameter rnmi_version

Set to this value	Description
none	RNMI not implemented
0.2.1	RNMI version 0.2.1

Table 8.5: Values for Parameter rnmi_version

8.1.5 Parameter debug_mode

Set to this value	Description	
none	Debug mode not implemented	
vector	Debug mode implemented by execution at vector	
interrupt	Debug mode implemented by interrupt	

halt	Debug mode implemented by halt

Table 8.6: Values for Parameter debug_mode

8.1.6 Parameter Zcea_version

Set to this value Description	
none	Zcea not implemented
0.50.1	Zcea version 0.50.1

Table 8.7: Values for Parameter Zcea_version

8.1.7 Parameter Zceb_version

Set to this value Description	
none	Zceb not implemented
0.50.1	Zceb version 0.50.1

Table 8.8: Values for Parameter Zeeb_version

8.1.8 Parameter Zcee_version

Set to this value	Description	
none	Zcee not implemented	
1.0.0-rc	Zcee version 1.0.0-rc	

Table 8.9: Values for Parameter Zcee_version

SExternalInterrupt	73	Supervisor external interrupt
MExternalInterrupt	75	Machine external interrupt

Table 10.1: Exceptions implemented in: Hart

Hierarchy of the model

A CPU core may be configured to instance many processors of a Symmetrical Multi Processor (SMP). A CPU core may also have sub elements within a processor, for example hardware threading blocks.

OVP processor models can be written to include SMP blocks and to have many levels of hierarchy. Some OVP CPU models may have a fixed hierarchy, and some may be configured by settings in a configuration register. Please see the register definitions of this model.

This model documentation shows the settings and hierarchy of the default settings for this model variant.

11.1 Level 1: Hart

This level in the model hierarchy has 5 commands.

This level in the model hierarchy has 5 register groups:

Group name	Registers
Core	33
User_Control_and_Status	64
Supervisor_Control_and_Status	12
Machine_Control_and_Status	135
Integration_support	4

Table 11.1: Register groups

This level in the model hierarchy has no children.

Model Commands

A Processor model can implement one or more **Model Commands** available to be invoked from the simulator command line, from the OP API or from the Imperas Multiprocessor Debugger.

12.1 Level 1: Hart

12.1.1 dumpTLB

12.1.1.1 Argument description

show TLB contents

12.1.2 getCSRIndex

Return index for a named CSR (or -1 if no matching CSR)

Argument	Type	Description
-name	String	CSR name

Table 12.1: getCSRIndex command arguments

12.1.3 isync

specify instruction address range for synchronous execution

Argument	Type	Description		
-addresshi	Uns64	end address of synchronous execution range		
-addresslo	Uns64	start address of synchronous execution range		

Table 12.2: isync command arguments

12.1.4 itrace

enable or disable instruction tracing

Argument	Type	Description
-after	Uns64	apply after this many instructions
-enable	Boolean	enable instruction tracing

-instructioncount	Boolean	include the instruction number in each trace
-memory	String	show memory accesses by this instruction. Ar-
		gument can be any combination of X (execute),
		L (load or store access) and S (system)
-off	Boolean	disable instruction tracing
-on	Boolean	enable instruction tracing
-processorname	Boolean	Include processor name in all trace lines
-registerchange	Boolean	show registers changed by this instruction
-registers	Boolean	show registers after each trace

Table 12.3: itrace command arguments

12.1.5 listCSRs

12.1.5.1 Argument description

List all CSRs in index order

Registers

13.1 Level 1: Hart

13.1.1 Core

Registers at level:1, type:Hart group:Core

Name	Bits	Initial-Hex	RW	Description

Table 13.4: Registers at level 1, type:Hart group:Machine_Control_and_Status

13.1.5 Integration_support

Registers at level:1, type:Hart group:Integration_support

Name	Bits	Initial-Hex	RW	Description
commercial	8	0	r-	Commercial feature in use
PTWStage	8	0	r-	PTW active stage (0:none 1:HS 2:VS 3:G)
PTWInputAddr	64	0	r-	PTW input address
PTWLevel	8	0	r-	PTW active level
