## Overview

This document provides the details of an OVP Fast Processor Model variant.

OVP Fast Processor Models are written in C and provide a C API for use in C based platforms. The models also provide a native interface for use in SystemC TLM2 platforms.

The models are written using the OVP VMI API that provides a Virtual Machine Interface that defines the behavior of the processor. The VMI API makes a clear line between model and simulator allowing very good optimization and world class high speed performance. Most models are provided as a binary shared object and also as source. This allows the download and use of the model binary or the use of the source to explore and modify the model.

The models are run through an extensive QA and regression testing process and most model families are validated using technology provided by the processor IP owners. There is a companion document (OVP Guide to Using Processor Models) which explains the general concepts of OVP Fast Processor Models and their use. It is downloadable from the OVPworld website documentation pages.

## 1.1 Description

RISC-V RV32GCB 32-bit processor model

## 1.2 Licensing

This Model is released under the Open Source Apache 2.0

## 1.3 Extensions

## 1.3.1 Extensions Enabled by Default

The model has the following architectural extensions enabled, and the corresponding bits in the misa CSR Extensions field will be set upon reset:

```
misa bit 0: extension A (atomic instructions)
```

misa bit 2: extension C (compressed instructions)

misa bit 3: extension D (double-precision floating point)

misa bit 5: extension F (single-precision floating point)

misa bit 8: RV32I/RV64I/RV128I base integer instruction set

misa bit 12: extension M (integer multiply/divide instructions)

misa bit 18: extension S (Supervisor mode)

misa bit 20: extension U (User mode)

In addition, the model has the following architectural extensions implicitly enabled (not shown in the misa CSR Extensions field):

```
misa bit 1: extension B (bit manipulation extension)
```

To specify features that can be dynamically enabled or disabled by writes to the misa register in addition to those listed above, use parameter "add\_Extensions\_mask". This is a string parameter containing the feature letters to add; for example, value "DV" indicates that double-precision floating point and the Vector Extension can be enabled or disabled by writes to the misa register, if supported on this variant. Parameter "sub\_Extensions\_mask" can be used to disable dynamic update of features in the same way.

Legacy parameter "misa\_Extensions\_mask" can also be used. This Uns32-valued parameter specifies all writable bits in the misa Extensions field, replacing any permitted bits defined in the base variant.

Note that any features that are indicated as present in the misa mask but absent in the misa will be ignored. See the next section.

### 1.3.2 Enabling Other Extensions

The following extensions are supported by the model, but not enabled by default in this variant:

misa bit 4: RV32E base integer instruction set (embedded)

misa bit 7: extension H (hypervisor)

misa bit 10: extension K (cryptographic)

misa bit 13: extension N (user-level interrupts)

misa bit 15: extension P (DSP instructions)

misa bit 21: extension V (vector extension)

misa bit 23: extension X (non-standard extensions present)

To add features from this list to the visible set in the misa register, use parameter "add\_Extensions". This is a string containing identification letters of features to enable; for example, value "DV" indicates that double-precision floating point and the Vector Extension should be enabled, if they are currently absent and are available on this variant.

Legacy parameter "misa\_Extensions" can also be used. This Uns32-valued parameter specifies the reset value for the misa CSR Extensions field, replacing any permitted bits defined in the base variant.

To add features from this list to the implicitly-enabled set (not visible in the misa register), use parameter "add\_implicit\_Extensions". This is a string parameter in the same format as the "add\_Extensions" parameter described above.

## 1.3.3 Disabling Extensions

The following extensions are enabled by default in the model and can be disabled:

misa bit 0: extension A (atomic instructions)

misa bit 1: extension B (bit manipulation extension)

misa bit 2: extension C (compressed instructions)

misa bit 3: extension D (double-precision floating point)

misa bit 5: extension F (single-precision floating point)

misa bit 12: extension M (integer multiply/divide instructions)

misa bit 18: extension S (Supervisor mode)

misa bit 20: extension U (User mode)

To disable features that are enabled by default, use parameter "sub\_Extensions". This is a string containing identification letters of features to disable; for example, value "DF" indicates that double-precision and single-precision floating point extensions should be disabled, if they are enabled by default on this variant.

To remove features from this list from the implicitly-enabled set (not visible in the misa register), use parameter "sub\_implicit\_Extensions". This is a string parameter in the same format as the "sub\_Extensions" parameter described above.

### 1.4 General Features

#### 1.4.1 mtvec CSR

On this variant, the Machine trap-vector base-address register (mtvec) is writable. It can instead be configured as read-only using parameter "mtvec\_is\_ro".

Values written to "mtvec" are masked using the value 0xfffffffd. A different mask of writable bits

may be specified using parameter "mtvec\_mask" if required. In addition, when Vectored interrupt mode is enabled, parameter "tvec\_align" may be used to specify additional hardware-enforced base address alignment. In this variant, "tvec\_align" defaults to 0, implying no alignment constraint.

If parameter "mtvec\_sext" is True, values written to "mtvec" are sign-extended from the most-significant writable bit. In this variant, "mtvec\_sext" is False, indicating that "mtvec" is not sign-extended.

The initial value of "mtvec" is 0x0. A different value may be specified using parameter "mtvec" if required.

#### 1.4.2 styec CSR

Values written to "stvec" are masked using the value 0xfffffffd. A different mask of writable bits may be specified using parameter "stvec\_mask" if required. In addition, when Vectored interrupt mode is enabled, parameter "tvec\_align" may be used to specify additional hardware-enforced base address alignment. In this variant, "tvec\_align" defaults to 0, implying no alignment constraint.

If parameter "stvec\_sext" is True, values written to "stvec" are sign-extended from the most-significant writable bit. In this variant, "stvec\_sext" is False, indicating that "stvec" is not sign-extended.

### 1.4.3 Reset

On reset, the model will restart at address 0x0. A different reset address may be specified using parameter "reset\_address" or applied using optional input port "reset\_addr" if required.

## 1.4.4 NMI

On an NMI, the model will restart at address 0x0; a different NMI address may be specified using parameter "nmi\_address" or applied using optional input port "nmi\_addr" if required. The cause reported on an NMI is 0x0 by default; a different cause may be specified using parameter "ecode\_nmi" or applied using optional input port "nmi\_cause" if required.

If parameter "rnmi\_version" is not "none", resumable NMIs are supported, managed by additional CSRs "mnscratch", "mnepc", "mncause" and "mnstatus", following the indicated version of the Resumable NMI extension proposal. In this variant, "rnmi\_version" is "none".

## 1.4.5 WFI

WFI will halt the processor until an interrupt occurs. It can instead be configured as a NOP using parameter "wfi\_is\_nop". WFI timeout wait is implemented with a time limit of 0 (i.e. WFI causes an Illegal Instruction trap in Supervisor mode when mstatus.TW=1).

## 1.4.6 cycle CSR

The "cycle" CSR is implemented in this variant. Set parameter "cycle\_undefined" to True to instead specify that "cycle" is unimplemented and reads of it should cause Illegal Instruction traps.

#### 1.4.7 time CSR

The "time" CSR is implemented in this variant. Set parameter "time\_undefined" to True to instead specify that "time" is unimplemented and reads of it should cause Illegal Instruction traps. Usually, the value of the "time" CSR should be provided by the platform - see notes below about the artifact "CSR" bus for information about how this is done.

#### 1.4.8 instret CSR

The "instret" CSR is implemented in this variant. Set parameter "instret\_undefined" to True to instead specify that "instret" is unimplemented and reads of it should cause Illegal Instruction traps.

## 1.4.9 hpmcounter CSRs

"hpmcounter" CSRs are implemented in this variant. Set parameter "hpmcounter\_undefined" to True to instead specify that "hpmcounter" CSRs are unimplemented and reads of them should cause Illegal Instruction traps.

### 1.4.10 Virtual Memory

This variant supports address translation modes 0 (bare) and 1 (Sv32). Use parameter "Sv\_modes" to specify a bit mask of different implemented modes if required; for example, setting "Sv\_modes" to (1 << 0)+(1 << 8) indicates that mode 0 (bare) and mode 8 (Sv39) are implemented. These indices correspond to writable values in the satp.MODE CSR field.

A 9-bit ASID is implemented. Use parameter "ASID\_bits" to specify a different implemented ASID size if required.

TLB behavior is controlled by parameter "ASIDCacheSize". If this parameter is 0, then an unlimited number of TLB entries will be maintained concurrently. If this parameter is non-zero, then only TLB entries for up to "ASIDCacheSize" different ASIDs will be maintained concurrently initially; as new ASIDs are used, TLB entries for less-recently used ASIDs are deleted, which improves model performance in some cases. If the model detects that the TLB entry cache is too small (entry ejections are very frequent), it will increase the cache size automatically. In this variant, "ASIDCacheSize" is 8.

## 1.4.11 Unaligned Accesses

Unaligned memory accesses are not supported by this variant. Set parameter "unaligned" to "T" to enable such accesses.

Unaligned memory accesses are not supported for AMO instructions by this variant. Set parameter "unalignedAMO" to "T" to enable such accesses.

#### 1.4.12 PMP

16 PMP entries are implemented by this variant. Use parameter "PMP\_registers" to specify a different number of PMP entries; set the parameter to 0 to disable the PMP unit. The PMP grain size (G) is 0, meaning that PMP regions as small as 4 bytes are implemented. Use parameter "PMP\_grain" to specify a different grain size if required. Unaligned PMP accesses are not decomposed into separate aligned accesses; use parameter "PMP\_decompose" to modify this behavior if required.

## 1.4.13 LR/SC Granule

LR/SC instructions are implemented with a 1-byte reservation granule. A different granule size may be specified using parameter "lr\_sc\_grain".

## 1.5 Compressed Extension

Standard compressed instructions are present in this variant.

Parameter Zcea\_version is used to specify the version of Zcea instructions present. By default, Zcea\_version is set to "none" in this variant. Updates to this parameter require a commercial product license.

Parameter Zceb\_version is used to specify the version of Zceb instructions present. By default, Zceb\_version is set to "none" in this variant. Updates to this parameter require a commercial product license.

Parameter Zcee\_version is used to specify the version of Zcee instructions present. By default, Zcee\_version is set to "none" in this variant. Updates to this parameter require a commercial product license.

## 1.6 Floating Point Features

The D extension is enabled in this variant independently of the F extension. Set parameter "d\_requires\_f" to "T" to specify that the D extension requires the F extension to be enabled.

Half precision floating point is not implemented. Use parameter "Zfh" to enable this if required.

By default, the processor starts with floating-point instructions disabled (mstatus.FS=0). Use

parameter "mstatus\_FS" to force mstatus.FS to a non-zero value for floating-point to be enabled from the start.

The specification is imprecise regarding the conditions under which mstatus.FS is set to Dirty state (3). Parameter "mstatus\_fs\_mode" can be used to specify the required behavior in this model, as described below.

If "mstatus\_fs\_mode" is set to "always\_dirty" then the model implements a simplified floating point status view in which mstatus.FS holds values 0 (Off) and 3 (Dirty) only; any write of values 1 (Initial) or 2 (Clean) from privileged code behave as if value 3 was written.

If "mstatus\_fs\_mode" is set to "write\_1" then mstatus.FS will be set to 3 (Dirty) by any explicit write to the fflags, frm or fcsr control registers, or by any executed instruction that writes an FPR, or by any executed floating point compare or conversion to integer/unsigned that signals a floating point exception. Floating point compare or conversion to integer/unsigned instructions that do not signal an exception will not set mstatus.FS.

If "mstatus\_fs\_mode" is set to "write\_any" then mstatus.FS will be set to 3 (Dirty) by any explicit write to the fflags, frm or fcsr control registers, or by any executed instruction that writes an FPR, or by any executed floating point compare or conversion even if those instructions do not signal a floating point exception.

In this variant, "mstatus\_fs\_mode" is set to "write\_1".

## 1.7 Privileged Architecture

This variant implements the Privileged Architecture with version specified in the References section of this document. Note that parameter "priv\_version" can be used to select the required architecture version; see the following sections for detailed information about differences between each supported version.

#### 1.7.1 Legacy Version 1.10

1.10 version of May 7 2017.

#### 1.7.2 Version 20190608

Stable 1.11 version of June 8 2019, with these changes compared to version 1.10:

- mcountinhibit CSR defined;
- pages are never executable in Supervisor mode if page table entry U bit is 1;
- mstatus.TW is writable if any lower-level privilege mode is implemented (previously, it was just if Supervisor mode was implemented);

#### 1.7.3 Version master

Unstable master version corresponding to evolving 1.12 specification, with these changes compared to version 20190608:

- mstatush, mseccfg, mseccfgh, menvcfg, menvcfgh, senvcfg, henvcfgh and mconfigptr CSRs defined;
- xret instructions clear mstatus.MPRV when leaving Machine mode if new mode is less privileged than M-mode;
- maximum number of PMP registers increased to 64;
- data endian is now configurable.

## 1.8 Unprivileged Architecture

This variant implements the Unprivileged Architecture with version specified in the References section of this document. Note that parameter "user\_version" can be used to select the required architecture version; see the following sections for detailed information about differences between each supported version.

## 1.8.1 Legacy Version 2.2

2.2 version of May 7 2017.

#### 1.8.2 Version 20191213

Stable 20191213-Base-Ratified version of December 13 2019, with these changes compared to version 2.2:

- floating point fmin/fmax instruction behavior modified to comply with IEEE 754-201x.
- numerous other optional behaviors can be separately enabled using Z-prefixed parameters.

## 1.9 Bit-Manipulation Extension

This variant implements the Bit-Manipulation extension with version specified in the References section of this document. Note that parameter "bitmanip\_version" can be used to select the required version of this extension. See section "Bit-Manipulation Extension Versions" for detailed information about differences between each supported version.

### 1.9.1 Bit-Manipulation Extension Parameters

Parameter Zbb is used to specify that the base instructions are present. By default, Zbb is set to 1 in this variant. Updates to this parameter require a commercial product license.

Parameter Zba is used to specify that address calculation instructions are present. By default, Zba is set to 1 in this variant. Updates to this parameter require a commercial product license.

Parameter Zbc is used to specify that carryless operation instructions are present. By default, Zbc is set to 1 in this variant. Updates to this parameter require a commercial product license.

Parameter Zbe is used to specify that bit deposit/extract instructions are present. By default, Zbe is set to 0 in this variant. Updates to this parameter require a commercial product license. This parameter is ignored for version 1.0.0, which does not implement that subset.

Parameter Zbf is used to specify that bit field place instructions are present. By default, Zbf is set to 0 in this variant. Updates to this parameter require a commercial product license. This parameter is ignored for version 1.0.0, which does not implement that subset.

Parameter Zbm is used to specify that bit matrix operation instructions are present. By default, Zbm is set to 0 in this variant. Updates to this parameter require a commercial product license. This parameter is ignored for version 1.0.0, which does not implement that subset.

Parameter Zbp is used to specify that permutation instructions are present. By default, Zbp is set to 0 in this variant. Updates to this parameter require a commercial product license. This parameter is ignored for version 1.0.0, which does not implement that subset.

Parameter Zbr is used to specify that CRC32 instructions are present. By default, Zbr is set to 0 in this variant. Updates to this parameter require a commercial product license. This parameter is ignored for version 1.0.0, which does not implement that subset.

Parameter Zbs is used to specify that single bit instructions are present. By default, Zbs is set to 1 in this variant. Updates to this parameter require a commercial product license.

Parameter Zbt is used to specify that ternary instructions are present. By default, Zbt is set to 0 in this variant. Updates to this parameter require a commercial product license. This parameter is ignored for version 1.0.0, which does not implement that subset.

#### 1.9.2 Bit-Manipulation Extension Versions

The Bit-Manipulation Extension specification has been under active development. To enable simulation of hardware that may be based on an older version of the specification, the model implements behavior for a number of previous versions of the specification. The differing features of these are listed below, in chronological order.

#### 1.9.3 Version 0.90

Stable 0.90 version of June 10 2019.

## 1.9.4 Version 0.91

Stable 0.91 version of August 29 2019, with these changes compared to version 0.90:

- change encodings of bmatxor, grev, grevw, grevi and greviw;

- add gorc, gorcw, gorci, gorciw, bfp and bfpw instructions.

#### 1.9.5 Version 0.92

Stable 0.92 version of November 8 2019, with these changes compared to version 0.91:

- add packh, packu and packuw instructions;
- add sext.b and sext.h instructions;
- change encoding and behavior of bfp and bfpw instructions;
- change encoding of bdep and bdepw instructions.

#### 1.9.6 Version 0.93-draft

Draft 0.93 version of January 29 2020, with these changes compared to version 0.92:

- add sh1add, sh2add, sh3add, sh1addu, sh2addu and sh3addu instructions;
- move slo, sloi, sro and sroi to Zbp subset;
- add orc16 to Zbb subset.

#### 1.9.7 Version 0.93

Stable 0.93 version of January 10 2021, with these changes compared to version 0.93-draft:

- assignments of instructions to Z extension groups changed;
- exchange encodings of max and minu instructions;
- add xperm.[nbhw] instructions;
- instructions named \*u.w renamed to \*.uw;
- instructions named sb\* renamed to b\*:
- instructions named pcnt\* renamed to cpop\*;
- instructions subu.w, addiwu, addwu, subwu, clmulw, clmulrw and clmulhw removed;
- instructions slo, sro, sloi, sroi, slow, srow, sloiw and sroiw removed from all Z extension groups and are therefore never implemented;
- instructions bext/bdep renamed to becompress/bdecompress (this change is documented under the draft 0.94 version but is required to resolve an instruction name conflict introduced by instruction renames above);

#### 1.9.8 Version 0.94

Stable 0.94 version of January 20 2021, with these changes compared to version 0.93:

- instructions bset[i]w, bclr[i]w, binv[i]w and bextw removed.

#### 1.9.9 Version 1.0.0

Stable 1.0.0 version of June 6 2021, with these changes compared to version 0.94:

- instructions with immediate shift operands now follow base architecture semantics to determine operand legality instead of masking to XLEN-1;
- only subsets Zba, Zbb, Zbc and Zbs may be enabled;
- if the B extension is present, it is implicitly always enabled and not subject to control by misa.B, which is zero.

### 1.9.10 Version master

Unstable master version, with these changes compared to version 1.0.0:

- any subset may be enabled;
- xperm.n, xperm.b, xperm.h and xperm.w instructions renamed xperm4, xperm8, xperm16 and xperm32.

## 1.10 Other Extensions

Other extensions that can be configured are described in this section.

### 1.10.1 Zmmul

Parameter "Zmmul" is 0 on this variant, meaning that all multiply and divide instructions are implemented. if "Zmmul" is set to 1 then multiply instructions are implemented but divide and remainder instructions are not implemented.

#### 1.10.2 Zicsr

Parameter "Zicsr" is 1 on this variant, meaning that standard CSRs and CSR access instructions are implemented. if "Zicsr" is set to 0 then standard CSRs and CSR access instructions are not implemented and an alternative scheme must be provided as a processor extension.

### 1.10.3 Zifencei

Parameter "Zifencei" is 1 on this variant, meaning that the fence.i instruction is implemented (but treated as a NOP by the model). if "Zifencei" is set to 0 then the fence.i instruction is not implemented.

#### 1.10.4 Zicbom

Parameter "Zicbom" is 0 on this variant, meaning that code block management instructions are undefined. if "Zicbom" is set to 1 then code block management instructions cbo.clean, cbo.flush and cbo.inval are defined.

If Zicbom is present, the cache block size is given by parameter "cmomp\_bytes". The instructions may cause traps if used illegally but otherwise are NOPs in this model.

## 1.10.5 Zicbop

Parameter "Zicbop" is 0 on this variant, meaning that prefetch instructions are undefined. if "Zicbop" is set to 1 then prefetch instructions prefetch.i, prefetch.r and prefetch.w are defined (but behave as NOPs in this model).

#### 1.10.6 Zicboz

Parameter "Zicboz" is 0 on this variant, meaning that the cbo.zero instruction is undefined. if "Zicboz" is set to 1 then the cbo.zero instruction is defined.

If Zicboz is present, the cache block size is given by parameter "cmoz\_bytes".

## 1.11 CLIC

The model can be configured to implement a Core Local Interrupt Controller (CLIC) using parameter "CLICLEVELS"; when non-zero, the CLIC is present with the specified number of interrupt levels (2-256), as described in the RISC-V Core-Local Interrupt Controller specification, and further parameters are made available to configure other aspects of the CLIC. "CLICLEVELS" is zero in this variant, indicating that a CLIC is not implemented.

## 1.12 Load-Reserved/Store-Conditional Locking

By default, LR/SC locking is implemented automatically by the model and simulator, with a reservation granule defined by the "lr\_sc\_grain" parameter. It is also possible to implement locking externally to the model in a platform component, using the "LR\_address", "SC\_address" and "SC\_valid" net ports, as described below.

The "LR\_address" output net port is written by the model with the address used by a load-reserved instruction as it executes. This port should be connected as an input to the external lock management component, which should record the address, and also that an LR/SC transaction is active.

The "SC-address" output net port is written by the model with the address used by a store-conditional instruction as it executes. This should be connected as an input to the external lock management component, which should compare the address with the previously-recorded load-reserved address, and determine from this (and other implementation-specific constraints) whether

the store should succeed. It should then immediately write the Boolean success/fail code to the "SC\_valid" input net port of the model. Finally, it should update state to indicate that an LR/SC transaction is no longer active.

It is also possible to write zero to the "SC\_valid" input net port at any time outside the context of a store-conditional instruction, which will mark any active LR/SC transaction as invalid.

Irrespective of whether LR/SC locking is implemented internally or externally, taking any exception or interrupt or executing exception-return instructions (e.g. MRET) will always mark any active LR/SC transaction as invalid.

## 1.13 Active Atomic Operation Indication

The "AMO\_active" output net port is written by the model with a code indicating any current atomic memory operation while the instruction is active. The written codes are:

0: no atomic instruction active

- 1: AMOMIN active
- 2: AMOMAX active
- 3: AMOMINU active
- 4: AMOMAXU active
- 5: AMOADD active
- 6: AMOXOR active
- 7: AMOOR active
- 8: AMOAND active
- 9: AMOSWAP active
- 10: LR active
- 11: SC active

## 1.14 Interrupts

The "reset" port is an active-high reset input. The processor is halted when "reset" goes high and resumes execution from the reset address specified using the "reset\_address" parameter or "reset\_addr" port when the signal goes low. The "mcause" register is cleared to zero.

The "nmi" port is an active-high NMI input. The processor resumes execution from the address specified using the "nmi\_address" parameter or "nmi\_addr" port when the NMI signal goes high. The "mcause" register is cleared to zero.

All other interrupt ports are active high. For each implemented privileged execution level, there are by default input ports for software interrupt, timer interrupt and external interrupt; for example, for Machine mode, these are called "MSWInterrupt", "MTimerInterrupt" and "MExternalInter-

rupt", respectively. When the N extension is implemented, ports are also present for User mode. Parameter "unimp\_int\_mask" allows the default behavior to be changed to exclude certain interrupt ports. The parameter value is a mask in the same format as the "mip" CSR; any interrupt corresponding to a non-zero bit in this mask will be removed from the processor and read as zero in "mip", "mie" and "mideleg" CSRs (and Supervisor and User mode equivalents if implemented).

Parameter "external\_int\_id" can be used to enable extra interrupt ID input ports on each hart. If the parameter is True then when an external interrupt is applied the value on the ID port is sampled and used to fill the Exception Code field in the "mcause" CSR (or the equivalent CSR for other execution levels). For Machine mode, the extra interrupt ID port is called "MExternalInterruptID".

The "deferint" port is an active-high artifact input that, when written to 1, prevents any pendingand-enabled interrupt being taken (normally, such an interrupt would be taken on the next instruction after it becomes pending-and-enabled). The purpose of this signal is to enable alignment with hardware models in step-and-compare usage.

## 1.15 Debug Mode

The model can be configured to implement Debug mode using parameter "debug\_mode". This implements features described in Chapter 4 of the RISC-V External Debug Support specification with version specified by parameter "debug\_version" (see References). Some aspects of this mode are not defined in the specification because they are implementation-specific; the model provides infrastructure to allow implementation of a Debug Module using a custom harness. Features added are described below.

Parameter "debug\_mode" can be used to specify three different behaviors, as follows:

- 1. If set to value "vector", then operations that would cause entry to Debug mode result in the processor jumping to the address specified by the "debug\_address" parameter. It will execute at this address, in Debug mode, until a "dret" instruction causes return to non-Debug mode. Any exception generated during this execution will cause a jump to the address specified by the "dexc\_address" parameter.
- 2. If set to value "interrupt", then operations that would cause entry to Debug mode result in the processor simulation call (e.g. opProcessorSimulate) returning, with a stop reason of OP\_SR\_INTERRUPT. In this usage scenario, the Debug Module is implemented in the simulation harness.
- 3. If set to value "halt", then operations that would cause entry to Debug mode result in the processor halting. Depending on the simulation environment, this might cause a return from the simulation call with a stop reason of OP\_SR\_HALT, or debug mode might be implemented by another platform component which then restarts the debugged processor again.

### 1.15.1 Debug State Entry

The specification does not define how Debug mode is implemented. In this model, Debug mode is enabled by a Boolean pseudo-register, "DM". When "DM" is True, the processor is in Debug mode. When "DM" is False, mode is defined by "mstatus" in the usual way.

Entry to Debug mode can be performed in any of these ways:

- 1. By writing True to register "DM" (e.g. using opProcessorRegWrite) followed by simulation of at least one cycle (e.g. using opProcessorSimulate), dcsr cause will be reported as trigger;
- 2. By writing a 1 then 0 to net "haltreq" (using opNetWrite) followed by simulation of at least one cycle (e.g. using opProcessorSimulate);
- 3. By writing a 1 to net "resethaltreq" (using opNetWrite) while the "reset" signal undergoes a negedge transition, followed by simulation of at least one cycle (e.g. using opProcessorSimulate);
- 4. By executing an "ebreak" instruction when Debug mode entry for the current processor mode is enabled by dcsr.ebreakm, dcsr.ebreaks or dcsr.ebreaku.

In all cases, the processor will save required state in "dpc" and "dcsr" and then perform actions described above, depending in the value of the "debug\_mode" parameter.

## 1.15.2 Debug State Exit

Exit from Debug mode can be performed in any of these ways:

- 1. By writing False to register "DM" (e.g. using opProcessorRegWrite) followed by simulation of at least one cycle (e.g. using opProcessorSimulate);
- 2. By executing an "dret" instruction when Debug mode.

In both cases, the processor will perform the steps described in section 4.6 (Resume) of the Debug specification.

## 1.15.3 Debug Registers

When Debug mode is enabled, registers "dcsr", "dpc", "dscratch0" and "dscratch1" are implemented as described in the specification. These may be manipulated externally by a Debug Module using opProcessorRegRead or opProcessorRegWrite; for example, the Debug Module could write "dcsr" to enable "ebreak" instruction behavior as described above, or read and write "dpc" to emulate stepping over an "ebreak" instruction prior to resumption from Debug mode.

#### 1.15.4 Debug Mode Execution

The specification allows execution of code fragments in Debug mode. A Debug Module implementation can cause execution in Debug mode by the following steps:

- 1. Write the address of a Program Buffer to the program counter using opProcessorPCSet;
- 2. If "debug\_mode" is set to "halt", write 0 to pseudo-register "DMStall" (to leave halted state);
- 3. If entry to Debug mode was handled by exiting the simulation callback, call opProcessorSimulate or opRootModuleSimulate to resume simulation.

Debug mode will be re-entered in these cases:

1. By execution of an "ebreak" instruction; or:

#### 2. By execution of an instruction that causes an exception.

In both cases, the processor will either jump to the debug exception address, or return control immediately to the harness, with stopReason of OP\_SR\_INTERRUPT, or perform a halt, depending on the value of the "debug\_mode" parameter.

## 1.15.5 Debug Single Step

When in Debug mode, the processor or harness can cause a single instruction to be executed on return from that mode by setting dcsr.step. After one non-Debug-mode instruction has been executed, control will be returned to the harness. The processor will remain in single-step mode until dcsr.step is cleared.

## 1.15.6 Debug Ports

Port "DM" is an output signal that indicates whether the processor is in Debug mode

Port "haltreq" is a rising-edge-triggered signal that triggers entry to Debug mode (see above).

Port "resethaltreq" is a level-sensitive signal that triggers entry to Debug mode after reset (see above).

## 1.16 Trigger Module

This model is configured with a trigger module, implementing a subset of the behavior described in Chapter 5 of the RISC-V External Debug Support specification with version specified by parameter "debug\_version" (see References).

#### 1.16.1 Trigger Module Restrictions

The model currently supports tdata1 of type 0, type 2 (mcontrol), type 3 (icount), type 4 (itrigger), type 5 (etrigger) and type 6 (mcontrol6). icount triggers are implemented for a single instruction only, with count hard-wired to 1 and automatic zeroing of mode bits when the trigger fires.

### 1.16.2 Trigger Module Parameters

Parameter "trigger\_num" is used to specify the number of implemented triggers. In this variant, "trigger\_num" is 4.

Parameter "tinfo" is used to specify the value of the read-only "tinfo" register, which indicates the trigger types supported. In this variant, "tinfo" is 0x7d.

Parameter "tinfo\_undefined" is used to specify whether the "tinfo" register is undefined, in which case reads of it trap to Machine mode. In this variant, "tinfo\_undefined" is 0.

Parameter "tcontrol\_undefined" is used to specify whether the "tcontrol" register is undefined, in which case accesses to it trap to Machine mode. In this variant, "tcontrol\_undefined" is 0.

Parameter "mcontext\_undefined" is used to specify whether the "mcontext" register is undefined, in which case accesses to it trap to Machine mode. In this variant, "mcontext\_undefined" is 0.

Parameter "scontext\_undefined" is used to specify whether the "scontext" register is undefined, in which case accesses to it trap to Machine mode. In this variant, "scontext\_undefined" is 0.

Parameter "mscontext\_undefined" is used to specify whether the "mscontext" register is undefined, in which case accesses to it trap to Machine mode. In this variant, "mscontext\_undefined" is 0.

Parameter "amo\_trigger" is used to specify whether load/store triggers are activated for AMO instructions. In this variant, "amo\_trigger" is 0.

Parameter "no\_hit" is used to specify whether the "hit" bit in tdata1 is unimplemented. In this variant, "no\_hit" is 0.

Parameter "no\_sselect\_2" is used to specify whether the "sselect" field in "textra32"/"textra64" registers is unable to hold value 2 (indicating match by ASID is not allowed). In this variant, "no\_sselect\_2" is 0.

Parameter "mcontext\_bits" is used to specify the number of writable bits in the "mcontext" register. In this variant, "mcontext\_bits" is 6.

Parameter "scontext\_bits" is used to specify the number of writable bits in the "scontext" register. In this variant, "scontext\_bits" is 16.

Parameter "mvalue\_bits" is used to specify the number of writable bits in the "mvalue" field in "textra32"/"textra64" registers; if zero, the "mselect" field is tied to zero. In this variant, "mvalue\_bits" is 6.

Parameter "svalue\_bits" is used to specify the number of writable bits in the "svalue" field in "textra32"/"textra64" registers; if zero, the "sselect" is tied to zero. In this variant, "svalue\_bits" is 16.

Parameter "mcontrol\_maskmax" is used to specify the value of field "maskmax" in the "mcontrol" register. In this variant, "mcontrol\_maskmax" is 63.

## 1.17 Debug Mask

It is possible to enable model debug messages in various categories. This can be done statically using the "override\_debugMask" parameter, or dynamically using the "debugflags" command. Enabled messages are specified using a bitmask value, as follows:

Value 0x002: enable debugging of PMP and virtual memory state;

Value 0x004: enable debugging of interrupt state.

All other bits in the debug bitmask are reserved and must not be set to non-zero values.

## 1.18 Integration Support

This model implements a number of non-architectural pseudo-registers and other features to facilitate integration.

## 1.18.1 CSR Register External Implementation

If parameter "enable\_CSR\_bus" is True, an artifact 16-bit bus "CSR" is enabled. Slave callbacks installed on this bus can be used to implement modified CSR behavior (use opBusSlaveNew or icmMapExternalMemory, depending on the client API). A CSR with index 0xABC is mapped on the bus at address 0xABC0; as a concrete example, implementing CSR "time" (number 0xC01) externally requires installation of callbacks at address 0xC010 on the CSR bus.

## 1.18.2 LR/SC Active Address

Artifact register "LRSCAddress" shows the active LR/SC lock address. The register holds all-ones if there is no LR/SC operation active or if LR/SC locking is implemented externally as described above.

## 1.18.3 Page Table Walk Introspection

Artifact register "PTWStage" shows the active page table translation stage (0 if no stage active, 1 if HS-stage active, 2 if VS-stage active and 3 if G-stage active). This register is visibly non-zero only in a memory access callback triggered by a page table walk event.

Artifact register "PTWInputAddr" shows the input address of active page table translation. This register is visibly non-zero only in a memory access callback triggered by a page table walk event.

Artifact register "PTWLevel" shows the active level of page table translation (corresponding to index variable "i" in the algorithm described by Virtual Address Translation Process in the RISC-V Privileged Architecture specification). This register is visibly non-zero only in a memory access callback triggered by a page table walk event.

## 1.18.4 Artifact Register "fflags\_i"

If parameter "enable\_fflags\_i" is True, an 8-bit artifact register "fflags\_i" is added to the model. This register shows the floating point flags set by the current instruction (unlike the standard "fflags" CSR, in which the flag bits are sticky).

## 1.19 Limitations

Instruction pipelines are not modeled in any way. All instructions are assumed to complete immediately. This means that instruction barrier instructions (e.g. fence.i) are treated as NOPs, with the exception of any Illegal Instruction behavior, which is modeled.

Caches and write buffers are not modeled in any way. All loads, fetches and stores complete immediately and in order, and are fully synchronous. Data barrier instructions (e.g. fence) are treated as NOPs, with the exception of any Illegal Instruction behavior, which is modeled.

Real-world timing effects are not modeled: all instructions are assumed to complete in a single cycle.

Hardware Performance Monitor registers are not implemented and hardwired to zero.

The TLB is architecturally-accurate but not device accurate. This means that all TLB maintenance and address translation operations are fully implemented but the cache is larger than in the real device.

## 1.20 Verification

All instructions have been extensively tested by Imperas, using tests generated specifically for this model and also reference tests from https://github.com/riscv/riscv-tests.

Also reference tests have been used from various sources including:

https://github.com/riscv/riscv-tests

https://github.com/ucb-bar/riscv-torture

The Imperas OVPsim RISC-V models are used in the RISC-V Foundation Compliance Framework as a functional Golden Reference:

https://github.com/riscv/riscv-compliance

where the simulated model is used to provide the reference signatures for compliance testing. The Imperas OVPsim RISC-V models are used as reference in both open source and commercial instruction stream test generators for hardware design verification, for example:

http://valtrix.in/sting from Valtrix

https://github.com/google/riscv-dv from Google

The Imperas OVPsim RISC-V models are also used by commercial and open source RISC-V Core RTL developers as a reference to ensure correct functionality of their IP.

## 1.21 References

The Model details are based upon the following specifications:

RISC-V Instruction Set Manual, Volume I: User-Level ISA (User Architecture Version 20191213)

RISC-V Instruction Set Manual, Volume II: Privileged Architecture (Privileged Architecture Version Ratified-IMFDQC-and-Priv-v1.11)

RISC-V "B" Bit Manipulation Extension (Bit Manipulation Architecture Version 1.0.0)

## Configuration

## 2.1 Location

This model's VLNV is riscv.ovpworld.org/processor/riscv/1.0.

The model source is usually at:

\$IMPERAS\_HOME/ImperasLib/source/riscv.ovpworld.org/processor/riscv/1.0

The model binary is usually at:

\$IMPERAS\_HOME/lib/\$IMPERAS\_ARCH/ImperasLib/riscv.ovpworld.org/processor/riscv/1.0

## 2.2 GDB Path

The default GDB for this model is: \$IMPERAS\_HOME/lib/\$IMPERAS\_ARCH/gdb/riscv-none-embed-gdb.

## 2.3 Semi-Host Library

The default semi-host library file is riscv.ovpworld.org/semihosting/pk/1.0

## 2.4 Processor Endian-ness

This is a LITTLE endian model.

## 2.5 QuantumLeap Support

This processor is qualified to run in a QuantumLeap enabled simulator.

## 2.6 Processor ELF code

The ELF code supported by this model is: 0xf3.

## **Bus Master Ports**

This model has these bus master ports.

Name	min	max	Connect?	Description
INSTRUCTION	32	34	mandatory	Instruction bus
DATA	32	34	optional	Data bus

Table 4.1: Bus Master Ports

## **Bus Slave Ports**

This model has no bus slave ports.

# Net Ports

This model has these net ports.

Name	Type	Connect?	Description
reset	input	optional	Reset
reset_addr	input	optional	externally-applied reset address
nmi	input	optional	NMI
nmi_cause	input	optional	externally-applied NMI cause
nmi_addr	input	optional	externally-applied NMI address
SSWInterrupt	input	optional	Supervisor software interrupt
MSWInterrupt	input	optional	Machine software interrupt
STimerInterrupt	input	optional	Supervisor timer interrupt
MTimerInterrupt	input	optional	Machine timer interrupt
SExternalInterrupt	input	optional	Supervisor external interrupt
MExternalInterrupt	input	optional	Machine external interrupt
irq_ack_o	output	optional	interrupt acknowledge (pulse)
irq_id_o	output	optional	acknowledged interrupt id (valid during
			irq_ack_o pulse)
sec_lvl_o	output	optional	current privilege level
LR_address	output	optional	Port written with effective address for LR
			instruction
SC_address	output	optional	Port written with effective address for SC
			instruction
SC_valid	input	optional	SC_address valid input signal
AMO_active	output	optional	Port written with code indicating active
			AMO
deferint	input	optional	Artifact signal causing interrupts to be
			held off when high

Table 6.1: Net Ports

# FIFO Ports

This model has no FIFO ports.

## Formal Parameters

Name	Type	Description
Fundamental		•
variant	Enumeration	Selects variant (either a generic UISA or a specific model)
user_version Enumeration		Specify required User Architecture version (2.2, 2.3, 20190305 or 20191213)
priv_version	Enumeration	Specify required Privileged Architecture version (1.10, 1.11, 20190405, 20190608 or master)
numHarts	Uns32	Specify the number of hart contexts in a multiprocessor
endian	Endian	Model endian
enable_expanded	Boolean	Specify that 48-bit and 64-bit expanded instructions are supported
endianFixed	Boolean	Specify that data endianness is fixed (mstatus.{MBE,SBE,UBE} fields are read-only)
misa_MXL	Uns32	Override default value of misa.MXL
misa_Extensions	Uns32	Override default value of misa. Extensions
$add_{-}Extensions$	String	Add extensions specified by letters to misa. Extensions (for example, specify "VD" to add V and D features)
sub_Extensions	String	Remove extensions specified by letters from misa. Extensions (for example, specify "VD" to remove V and D features)
misa_Extensions_mask	Uns32	Override mask of writable bits in misa. Extensions
add_Extensions_mask	String	Add extensions specified by letters to mask of writable bits in misa. Extensions (for example, specify "VD" to add V and D features)
sub_Extensions_mask String R		Remove extensions specified by letters from mask of writable bits in misa. Extensions (for example, specify "VD" to remove V and D features)
add_implicit_Extensions String		Add extensions specified by letters to implicitly-present extensions not visible in misa. Extensions
sub_implicit_Extensions	String	Remove extensions specified by letters from implicitly-present extensions not visible in misa. Extensions
Zicsr	Boolean	Specify that Zicsr is implemented
Zifencei	Boolean	Specify that Zifencei is implemented
Zicbom	Boolean	Specify that Zicbom is implemented
Zicbop	Boolean	Specify that Zicbop is implemented
Zicboz	Boolean	Specify that Zicboz is implemented
Zmmul	Boolean	Specify that Zmmul is implemented
Bit_Manipulation		
bitmanip_version	Enumeration	Specify required Bit Manipulation Architecture version (0.90, 0.91, 0.92, 0.93-draft, 0.93, 0.94, 1.0.0 or master)
Zba	Boolean	Specify that Zba is implemented (bit manipulation extension)
Zbb	Boolean	Specify that Zbb is implemented (bit manipulation extension)
Zbc	Boolean	Specify that Zbc is implemented (bit manipulation extension)
Zbe	Boolean	Specify that Zbe is implemented (bit manipulation extension; ignored if version 1.0.0)

Zbf	Boolean	Specify that Zbf is implemented (bit manipulation extension; ignored if version 1.0.0)		
Zbm	Boolean	Specify that Zbm is implemented (bit manipulation extension; ignored if version 1.0.0)		
Zbp	Boolean	Specify that Zbp is implemented (bit manipulation extension; ignored if version 1.0.0)		
Zbr	Boolean	Specify that Zbr is implemented (bit manipulation extension; ignored if version 1.0.0)		
Zbs	Boolean	Specify that Zbs is implemented (bit manipulation extension)		
Zbt	Boolean	Specify that Zbt is implemented (bit manipulation extension; ignored if version 1.0.0)		
Debug				
debug_version	Enumeration	Specify required Debug Architecture version (0.13.2-DRAFT, 0.14.0-DRAFT or 1.0.0-STABLE)		
debug_mode	Enumeration	Specify how Debug mode is implemented (none, vector, interrupt or halt)		
Interrupts_Exceptions				
rnmi_version	Enumeration	Specify required RNMI Architecture version (none or 0.2.1)		
mtvec_is_ro	Boolean	Specify whether mtvec CSR is read-only		
tvec_align	Uns32	Specify hardware-enforced alignment of mtvec/stvec/utvec when Vectored interrupt mode enabled		
ecode_mask	Uns64	Specify hardware-enforced mask of writable bits in xcause. ExceptionCode		
ecode_nmi	Uns64	Specify xcause.ExceptionCode for NMI		
tval_zero	Boolean	Specify whether mtval/stval/utval are hard wired to zero		
tval_zero_ebreak	Boolean	Specify whether mtval/stval/utval are set to zero by an ebreak		
tval_ii_code	Boolean	Specify whether mtval/stval contain faulting instruction bits on illegal instruction exception		
trap_preserves_lr	Boolean	Whether a trap preserves active LR/SC state		
xret_preserves_lr	Boolean	Whether an xret instruction preserves active LR/SC state		
reset_address	Uns64	Override reset vector address		
nmi_address	Uns64	Override NMI vector address		
CLINT_address	Uns64	Specify base address of internal CLINT model (or 0 for no CLINT)		
local_int_num	Uns32	Specify number of supplemental local interrupts		
unimp_int_mask	Uns64	Specify mask of unimplemented interrupts (e.g. 1<<9 indicates Supervisor external interrupt unimplemented)		
force_mideleg	Uns64	Specify mask of interrupts always delegated to lower-priority execution level from Machine execution level		
force_sideleg	Uns64	Specify mask of interrupts always delegated to User execution level from Supervisor execution level		
no_ideleg	Uns64	Specify mask of interrupts that cannot be delegated to lower-priority execution levels		
no_edeleg	Uns64	Specify mask of exceptions that cannot be delegated to lower-priority execution levels		
external_int_id	Boolean	Whether to add nets allowing External Interrupt ID codes to be forced		
Floating_Point		-		
mstatus_fs_mode	Enumeration	Specify conditions causing update of mstatus.FS to dirty (write_1, write_any or always_dirty)		
d_requires_f	Boolean	If D and F extensions are separately enabled in the misa CSR, whether D is enabled only if F is enabled		
enable_fflags_i	Boolean	Whether fflags_i artifact register present (shows per-instruction floating point flags)		
mstatus_FS	Uns32	Override default value of mstatus.FS (initial state of floating point unit)		
Zfh	Boolean	Specify that Zfh is implemented (IEEE half-precision floating point is supported)		
Zfhmin	Boolean	Specify that Zfhmin is implemented (restricted IEEE half-precision float-		

Zfinx_version	Enumeration	Specify version of Zfinx implemented (use integer register file for floating point instructions) (none, 0.4 or 0.41)
Simulation_Artifact		
use_hw_reg_names Boolean		Specify whether to use hardware register names x0-x31 and f0-f31 instead of ABI register names
ABI_d	Boolean	Specify whether D registers are used for parameters (ABI SemiHosting)
verbose	Boolean	Specify verbose output messages
traceVolatile	Boolean	Specify whether volatile registers (e.g. minstret) should be shown in change trace
enable_CSR_bus	Boolean	Add artifact CSR bus port, allowing CSR registers to be externally implemented
CSR_remap	String	Comma-separated list of CSR number mappings, each of the form <csr-name>=<number></number></csr-name>
ASID_cache_size	Uns32	Specifies the number of different ASIDs for which TLB entries are cached; a value of 0 implies no limit
Memory		
updatePTEA	Boolean	Specify whether hardware update of PTE A bit is supported
updatePTED	Boolean	Specify whether hardware update of PTE D bit is supported
unaligned	Boolean	Specify whether the processor supports unaligned memory accesses
${\rm unaligned AMO}$	Boolean	Specify whether the processor supports unaligned memory accesses for AMO instructions
ASID_bits	Uns32	Specify the number of implemented ASID bits
lr_sc_grain	Uns32	Specify byte granularity of ll/sc lock region (constrained to a power of two)
PMP_grain	Uns32	Specify PMP region granularity, G (0 =>4 bytes, 1 =>8 bytes, etc)
PMP_registers	Uns32	Specify the number of implemented PMP address registers
PMP_max_page	Uns32	Specify the maximum size of PMP region to map if non-zero (may improve performance; constrained to a power of two)
PMP_decompose	Boolean	Whether unaligned PMP accesses are decomposed into separate aligned accesses
Sv_modes	Uns32	Specify bit mask of implemented address translation modes (e.g. $(1 << 0)+(1 << 8)$ indicates "bare" and "Sv39" modes may be selected in satp.MODE)
Svnapot_page_mask	Uns64	Specify mask of implemented Svnapot intermediate page sizes (e.g. 1<<16 means 64KiB contiguous regions are supported)
Svpbmt	Boolean	Specify that Sypbmt is implemented (page-based memory types)
Svinval	Boolean	Specify that Svinval is implemented (fine-grained address translation cache invalidation)
$Instruction\_CSR\_Behavior$		
wfi_is_nop	Boolean	Specify whether WFI should be treated as a NOP (if not, halt while waiting for interrupts)
counteren_mask	Uns32	Specify hardware-enforced mask of writable bits in mcounteren/scounteren registers
noinhibit_mask	Uns32	Specify hardware-enforced mask of always-zero bits in mcountinhibit register
cycle_undefined	Boolean	Specify that the cycle CSR is undefined
time_undefined	Boolean	Specify that the time CSR is undefined
$instret\_undefined$	Boolean	Specify that the instret CSR is undefined
hpmcounter_undefined	Boolean	Specify that the hpmcounter CSRs are undefined
$CSR\_Masks$		
mtvec_mask	Uns64	Specify hardware-enforced mask of writable bits in mtvec register
stvec_mask	Uns64	Specify hardware-enforced mask of writable bits in stvec register
tdata1_mask	Uns64	Specify hardware-enforced mask of writable bits in Trigger Module tdata1 register
mip_mask	Uns64	Specify hardware-enforced mask of writable bits in mip register
sip_mask	Uns64	Specify hardware-enforced mask of writable bits in sip register

mtvec_sext	Boolean	Specify whether mtvec is sign-extended from most-significant bit
stvec_sext Boolean		Specify whether stvec is sign-extended from most-significant bit
Trigger		
tinfo_undefined Boolean		Specify that the tinfo CSR is undefined
tcontrol_undefined	Boolean	Specify that the tcontrol CSR is undefined
mcontext_undefined	Boolean	Specify that the mcontext CSR is undefined
$scontext\_undefined$	Boolean	Specify that the scontext CSR is undefined
$mscontext\_undefined$	Boolean	Specify that the mscontext CSR is undefined (Debug Version 0.14.0 and
		later)
amo_trigger	Boolean	Specify whether AMO load/store operations activate triggers
no_hit	Boolean	Specify that tdata1.hit is unimplemented
no_sselect_2	Boolean	Specify that textra.sselect=2 is not supported (no trigger match by ASID)
trigger_num	Uns32	Specify the number of implemented hardware triggers
tinfo	Uns32	Override tinfo register (for all triggers)
mcontext_bits	Uns32	Specify the number of implemented bits in mcontext
scontext_bits	Uns32	Specify the number of implemented bits in scontext
mvalue_bits	Uns32	Specify the number of implemented bits in textra.mvalue (if zero, tex-
		tra.mselect is tied to zero)
svalue_bits	Uns32	Specify the number of implemented bits in textra.svalue (if zero, tex-
		tra.sselect is tied to zero)
mcontrol_maskmax	Uns32	Specify mcontrol.maskmax value
CSR_Defauts		
mvendorid	Uns64	Override mvendorid register
marchid	Uns64	Override marchid register
mimpid	Uns64	Override mimpid register
mhartid	Uns64	Override mhartid register (or first mhartid of an incrementing sequence if
		this is an SMP variant)
mtvec	Uns64	Override mtvec register
Compressed		
Zcea_version	Enumeration	Specify version of Zcea implemented (code-size reduction extension) (none
		or 0.50.1)
Zceb_version	Enumeration	Specify version of Zceb implemented (code-size reduction extension) (none
		or 0.50.1)
Zcee_version	Enumeration	Specify version of Zcee implemented (code-size reduction extension) (none
		or 1.0.0-rc)
Fast_Interrupt		
CLICLEVELS	Uns32	Specify number of interrupt levels implemented by CLIC, or 0 if CLIC
		absent

Table 8.1: Parameters that can be set in: Hart

## 8.1 Parameters with enumerated types

## 8.1.1 Parameter user\_version

Set to this value	Description
2.2	User Architecture Version 2.2
2.3	Deprecated and equivalent to 20191213
20190305	Deprecated and equivalent to 20191213
20191213	User Architecture Version 20191213

Table 8.2: Values for Parameter user\_version

## 8.1.2 Parameter priv\_version

Set to this value	Description
1.10	Privileged Architecture Version 1.10
1.11	Deprecated and equivalent to 20190608
20190405	Deprecated and equivalent to 20190608
20190608	Privileged Architecture Version Ratified-IMFDQC-and-Priv-v1.11
master	Privileged Architecture Master Branch (1.12 draft)

Table 8.3: Values for Parameter priv\_version

## 8.1.3 Parameter bitmanip\_version

Set to this value	Description
0.90	Bit Manipulation Architecture Version v0.90-20190610
0.91	Bit Manipulation Architecture Version v0.91-20190829
0.92	Bit Manipulation Architecture Version v0.92-20191108
0.93-draft	Bit Manipulation Architecture Version 0.93-draft-20200129
0.93	Bit Manipulation Architecture Version v0.93-20210110
0.94	Bit Manipulation Architecture Version v0.94-20210120
1.0.0	Bit Manipulation Architecture Version 1.0.0
master	Bit Manipulation Master Branch as of commit 1f56afe (this is subject to change)

Table 8.4: Values for Parameter bitmanip\_version

## 8.1.4 Parameter debug\_version

Set to this value	r
0.13.2-DRAFT	RISC-V External Debug Support Version 0.13.2-DRAFT
0.14.0-DRAFT	RISC-V External Debug Support Version 0.14.0-DRAFT
1.0.0-STABLE	RISC-V External Debug Support Version 1.0.0-STABLE

Table 8.5: Values for Parameter debug\_version

## 8.1.5 Parameter rnmi\_version

Set to this value	Description
none	RNMI not implemented
0.2.1	RNMI version 0.2.1

Table 8.6: Values for Parameter rnmi\_version

## 8.1.6 Parameter mstatus\_fs\_mode

Set to this value	Description	
write_1	Any non-zero flag result sets mstatus.fs dirty	
write_any	Any write of flags sets mstatus.fs dirty	
always_dirty	mstatus.fs is either off or dirty	

Table 8.7: Values for Parameter mstatus\_fs\_mode

## 8.1.7 Parameter debug\_mode

Set to this value	Description
none	Debug mode not implemented
vector	Debug mode implemented by execution at vector
interrupt	Debug mode implemented by interrupt
halt	Debug mode implemented by halt

Table 8.8: Values for Parameter debug\_mode

### 8.1.8 Parameter Zfinx\_version

Set to this value	Description
none	Zfinx not implemented
0.4	Zfinx version 0.4
0.41	Zfinx version 0.41

Table 8.9: Values for Parameter Zfinx\_version

## 8.1.9 Parameter Zcea\_version

Set to this value	Description
none	Zcea not implemented
0.50.1	Zcea version 0.50.1

Table 8.10: Values for Parameter Zcea\_version

### 8.1.10 Parameter Zceb\_version

Set to this value	Description
none	Zceb not implemented
0.50.1	Zceb version 0.50.1

Table 8.11: Values for Parameter Zceb\_version

### 8.1.11 Parameter Zcee\_version

Set to this value	Description	
none	Zcee not implemented	
1.0.0-rc	Zcee version 1.0.0-rc	

Table 8.12: Values for Parameter Zcee\_version

## 8.2 Parameter values

These are the current parameter values.

Name	Value
Fundamental	
variant	RV32GCB
user_version	20191213
priv_version	20190608

Table 8.13: Parameter values

# **Execution Modes**

Mode	Code	Description
User	0	User mode
Supervisor	1	Supervisor mode
Machine	3	Machine mode

Table 9.1: Modes implemented in: Hart

# Exceptions

Exception	Code	Description	
InstructionAddressMisaligned	0	Fetch from unaligned address	
InstructionAccessFault	1	No access permission for fetch	
IllegalInstruction	2	Undecoded, unimplemented or disabled instruc-	
		tion	
Breakpoint	3	EBREAK instruction executed	
LoadAddressMisaligned	4	Load from unaligned address	
LoadAccessFault	5	No access permission for load	
StoreAMOAddressMisaligned	6	Store/atomic memory operation at unaligned	
		address	
StoreAMOAccessFault	7	No access permission for store/atomic memory	
		operation	
EnvironmentCallFromUMode	8	ECALL instruction executed in User mode	
EnvironmentCallFromSMode	9	ECALL instruction executed in Supervisor	
		mode	
EnvironmentCallFromMMode	11	ECALL instruction executed in Machine mode	
InstructionPageFault	12	Page fault at fetch address	
LoadPageFault	13	Page fault at load address	
StoreAMOPageFault	15	Page fault at store/atomic memory operation	
		address	
SSWInterrupt	65	Supervisor software interrupt

MExternalInterrupt	75	Machine external interrupt	

Table 10.1: Exceptions implemented in: Hart

# Hierarchy of the model

A CPU core may be configured to instance many processors of a Symmetrical Multi Processor (SMP). A CPU core may also have sub elements within a processor, for example hardware threading blocks.

OVP processor models can be written to include SMP blocks and to have many levels of hierarchy. Some OVP CPU models may have a fixed hierarchy, and some may be configured by settings in a configuration register. Please see the register definitions of this model.

This model documentation shows the settings and hierarchy of the default settings for this model variant.

## 11.1 Level 1: Hart

This level in the model hierarchy has 5 commands.

This level in the model hierarchy has 6 register groups:

Group name	Registers
Core	33
Floating_point	32
User_Control_and_Status	67
Supervisor_Control_and_Status	12
Machine_Control_and_Status	135
Integration_support	5

Table 11.1: Register groups

This level in the model hierarchy has no children.

# **Model Commands**

A Processor model can implement one or more **Model Commands** available to be invoked from the simulator command line, from the OP API or from the Imperas Multiprocessor Debugger.

## 12.1 Level 1: Hart

### 12.1.1 dumpTLB

#### 12.1.1.1 Argument description

show TLB contents

## 12.1.2 getCSRIndex

Return index for a named CSR (or -1 if no matching CSR)

Argument	Type	Description
-name	String	CSR name

Table 12.1: getCSRIndex command arguments

## 12.1.3 isync

specify instruction address range for synchronous execution

Argument	Type	Description			
-addresshi	Uns64	end address of synchronous execution range			
-addresslo	Uns64	start address of synchronous execution range			

Table 12.2: isync command arguments

#### 12.1.4 itrace

enable or disable instruction tracing

Argument	Type	Description
-after	Uns64	apply after this many instructions
-enable	Boolean	enable instruction tracing

-instructioncount	Boolean	include the instruction number in each trace
-memory	String	show memory accesses by this instruction. Ar-
		gument can be any combination of X (execute),
		L (load or store access) and S (system)
-off	Boolean	disable instruction tracing
-on	Boolean	enable instruction tracing
-processorname	Boolean	Include processor name in all trace lines
-registerchange	Boolean	show registers changed by this instruction
-registers	Boolean	show registers after each trace

Table 12.3: itrace command arguments

## 12.1.5 listCSRs

# 12.1.5.1 Argument description

List all CSRs in index order

# Registers
